This report prepared from 46.616 million reads of the ALTA 209 series.

Meta Art - Flavors, Monumental

The current thinking in western science, which has been pretty much promulgated globally, is that 'time' is but a component of 'space time', and further, that 'time' is basically the same everywhere and constantly. Yes there are minute levels of variation which have been 'scientifically detected', and now such variations have even led to the questioning of the presumed universal constant of the 'speed of light'.

 Human experience would beg to differ about time being a static component of life, ever flowing at a constant rate. The impressions, and experience of humans is that the *feel* of time is certainly not constant, regardless of the underlying flow of time. Humans 'feel' certain times to be different from other times, and thus the constant need to change our 'expressions' to 'keep up with the times'.

Every human will respond that they have 'felt' certain times to be more important/meaningful than others. Recent examples are easily found, and need only go back to 2001, or 2000 if the equities crash were to be considered as important/meaningful. For humans, time has a 'perceived pressure' component, and can seem to be 'filled up' with important events, or multitudinous examples of manifesting circumstances. This perceived pressure component can even be 'generational' within humans, and an example would be the difference in the "roaring twenties" generation, and the immediately following "great depression" generation. In both, the pressure component of the times formed the character of a whole generation of humans. Thus it has been all through history, and while many will claim that 'history is written by the winners', it is even more apparent that 'time writes history' through its 'pressure level'.

So for humans, time has a distinct ability to leave a lasting impression relating to how pressured was that time within the perceived event stream. This is 1/one of many components or 'aspects' of time which combine to give time a 'flavor', in so far as humans and their experience of time. The flavor of a time is what music and literature attempt, and sometimes succeed in capturing. The flavor of the time is boiled down to a thick syrupy mass, and then labeled with as few words as possible, and thus we end up with appellations such as the 'roaring twenties', or the 'booming 90's'. Within each sub set of humans, geographically, and socially, the experience of the 'flavor of the time' will vary somewhat based primarily on their position within the broader social order, but each will be able to recall emotional/mental context markers for specific 'times' which will, when reduced to words, bring in some of the larger social consensus of the 'flavor of that time'. Thus the compound or 'green' level of communications can exist whereby 'flavors' from previous experiences within time can be overlayed onto current discussions with a minimum level of words to provide yet another layer of meaning at a much deeper, and far reaching level. This 'consensus view' is socially ordered, and thus will have levels of nuance related to social/caste position, but in the main there will exist a common hierarchy of terms which can be gleaned across social convention boundary lines. So even those who experienced the USofA in the 'deep dixiecrat south' of the 1950's as 'minority participants', will nonetheless still have a common set of references to the 'wonder bread, bland suburb of Dick van Dyke'. Language uber alles, and it is

even the deeper level of experience which rose from being the official 'outcasts' of the time which added the extra 'time flavor' that the language then encapsulated into the term 'soul'. The 'soul' label which grew from that experience of that time flavor is a very good example as it has faded in meaning in the current 'time flavor', as the experience of the social order is now different, and minority status is less racial, and more economic. Note also the loss of meaning of other labels such as 'genteel poverty'...nothing at all genteel/gentle about being poor these days.

These time flavors are quintessentially human. Just a primary way in which we organize our relationship to universe. The shape of modelspace is suggesting that the period immediately ahead will have a very distinct change of time flavor. Time, as we know it, does not exist in small incremental steps, but is perceived as an enveloping flow within universe. The movement of modelspace is suggesting that the flow of time after October of this year will have a very much increased 'pressure component' to the 'taste' of it flavor than has been experienced even within recent past. This forecast arises from the larger patterns, and the accretion of event based, or manifesting circumstances based linguistic contexts within the shorter term and longer term value sets.

The accretion patterns within modelspace are pointing to a [monumental time] coming. In stopping to consider this linguistic construct for a moment, let us note that [monumental times] can be described as 'those times to which monuments are devoted'....hmmm. Probably that is not good for us, that is to say, those of us who have to live through these times as it implies [events of such significance that monuments are required to memorialize them at the cultural level]. Again, a big HMMMM goes here.

Populace/USofA - Movers and Shakers, Grief - Stage 1/One

The long hot Summer of the [continuing dollar crash] culminates in very high emotional values within the Populace/USofA over the [election] with [participation rates] shown as being at [exceptional levels]. The [participation rates] of the [populace] within the [election process] is shown as being counter balanced by an increasing number of [disaffected] persons who will be [withdrawing] from the current [social order]. Both trends are indicated to have [grown] over [summer] and the [travail] inflicted on the planet [global populace] as the [dollar] has [seizures] and [tremors] in its last days. The high emotions within those [caught] in the [political process] is what leads to our forecast that there will be [calls/cries] for an [early election], also interpreted as [let's just get it over with]. The sub text of this last interpretation could be read as '...since we all know who is going to win'. There are a number of supporting structures indicating that [mccain] will have [suffered] large and [debilitating] [failures] from mid [summer] through to a sort of 'peak of woes' in August/September. Both the [publicly visible failure/corruption], and the [health problems/mental illness displays] will have taken their toll, as will the [flight from the republican party] as a result of the [climate problems] and the [coercion/slavery issues] which also appear in late [summer]. The [slavery issues] will be directly [sprung] from the [corporatacracy] and will have some [insidious impacts] on the [vision] and [views] of the [republicans]. This will further be compounded by the [thrashing] which will hit [mccain] as a [candidate] on the [corruption] issues. Note that the [currents/flow] of the [corruption] meme linked to [mccain] will be in the non-corporate media, though it will be very much part of the global mediastream and hugely impacting. This precipitates the [calls for early election] meme within the [non mainstream media/corporate propagandists].

The progression of modelspace through [summer] also highlights the growth of the [opting out/transformation] sub set of the [populace]. This group has been previously described as being composed of [self organizing collectives of like minded individuals] who find themselves [motivated] to [move/relocate/alter life choices]. These data sets are supported by modifiers which include references to [beyond (their) understanding] among others which imply that

many of these [movers] will be [in transit] and still be [personally puzzled] as to what has happened in their lives to have caused such a [radical transformation], albeit, also described as [smooth] and [surprisingly easy/simple/effective]. What we call here at HPH a case of [harmonizing with universe]. This sub set grows at about the same rate as the [politically charged] sub set, but stems from a different archetype accrual pattern. Though both trends arise from the emotional core of [dissatisfaction/disruption] which feeds the [rebellion/revolution] context, the [movers] sub set contains modifiers and other sources which seemingly place the motivation of this group more clearly at [planetary transformation] and [perceived universe changes] at their focus. Thus, to a certain extent, the attitude being expressed is [all about priorities], and this trend has a much broader view that places [human species survival] above [local politics].

In both trends the supporting sets include aspect/attributes of [fundamentals] and [infrastructure], though the supporting sets in each of these is divergent. The [movers] sub set has [fundamentals] at a much lower level of emotional core than does the [politically captivated set]. In the supporting sets within the [fundamentals] aspect/attribute set for the [movers] are modifiers such as [biosphere], and [food supplies] at levels of much higher emotional values than are similar aspect/attribute sets within the [politically motivated] group. It appears that while most of the [populace/usofa] becomes [politically captivated] as a result of the [suffering] caused by the [death of the dollar] and the [hyperinflation] of [summer], a significant sub set perhaps as large as 2/two to 5/five per cent of the populace falls out of the [political system], and into the [movers] group. In the case of the [politically captivated] majority, the emotional driver is the [belief] that the current economic and social [disorder] can be fixed through the [political process/elections]. The smaller [mover] group is described as being [outside] of the [concerns] of [politics] per se, as their motivation is [participating (in) species survival]. This group apparently realizes that [no meaningful change] can be [created (by) politicians].

As modelspace is progressed through [summer] and into [fall], the [emotional tone] levels within the Populace/USofA rise dramatically. In August and through to early September, this emotive tension rise is due to [military] and [political] aspects, but as October is reached, the twin drivers for the emotional tone of the Populace/USofA are [economy/currency] and [terra intrusions]. Of these 2/two, the [economy/money] is at the highest level going into October, but by the time that modelspace has been moved through to January of 2009, our most significant rise in values comes from [terra intrusion] language. It is true that throughout Fall, and most of Winter, the emotional drivers for the Populace/USofA entity come from [economy/currency] with sub sets of [dollar death/hyperinflation], and [food supplies/energy supplies] and worries about [restrictions on movement], but by mid Winter, the emotional drivers begin to shift to more of a more [planet] focus. It is also true that increasing segments of the Populace/USofA shift over to [planet/climate] concerns in Fall as their personal encounters with [terra intrusions] occur, but it is not until the [brutal changes (in) climate] in late Fall/early Winter, that the majority of the Populace/USofA becomes [planet/climate focused] to the point where the [political process] becomes a second tier concern. In spite of the Spring China earthquake, and the [terra intrusions] of [earthquakes], [fires], [floods], and [winds] here in the USofA over Summer, the [corporatocracy propagandists] are still able to keep the majority focused on the [political world] rather than [real world] concerns. This is indicated to change abruptly in Fall as the [terra intrusions] once again show that [walls fall into the water], or [bricks return to the mud (from whence they came)]. The last time we had these associations was prior to the Katrina/Rita storm series. And we still have the [gouging/scarring winds] as a meme, and it is in direct support as well as being internally cross linked over to the [bricks back into mud] language set. This area grows to directly support the [emotional core transformation] of the [populace] which begins to manifest in December.

As the modelspace moves through to the very first days of December, 2008, the Populace/USofA entity is showing that [earthquake], both actual, and

cultural will [shake the populace to their core]. As part of this [cultural shake up], the [transformation] meta data layer is indicating that the [evangelical cabal], including their [politician captives/supporters] will have [lost] their [hold/strong influence] on the [body politic] of the [usofa]. Modelspace has a number of the [death of religion] sub sets in direct support, as well as many layers of [transformation] and [revolution] meta data layer sets within the supporting aspect/attribute sets. The data indicates that [scandals] will be prevalent during this period, especially as they relate to the [evangelical cabal], but that primarily the [flavor of the time] changes in October, and this new flavor does not support [faith based/controlling religions/religious organizations]. By December, the modelspace is indicating that the [visibility] of the [anti-religion, anti-establishment control] meme is well settled in, and new expressions of old themes such as [peace movement], and [anti militarism], and [anti-corporation], and [strong local collectives] will be emerging. Curiously, universe is apparently to provide for a [renewed/reinvigorate space race] as a national obsession, but again, note that the [revolution] will be underway in December, at least in the public perception, and this new [space race] theme will *not* be run by the [military/nasa], but will rather be [private/home_grown], and itself is indicated to [spark governmental resistance] which will result in an [anti government] backlash. This [emotional recoiling/repulsing] wave from the [populace] is indicated to be [shocking] to the [officialdom], especially the [agency], and its [military control system]. As the [military control system] is indicated to be [suffering] the results of the [rising abhorrence] within the [populace] of [all things military/empire adventurism], the [agency] is indicated to be [forced] to [capitulate]. Please note the latin nature of the [capitulate] aspect....as in to [lose one's head]. This will be far more appropriate an aspect than it may appear now.

A very small part of the [cultural transformation] within the [populace/USofA] will be on display, as indicated by its rising [visibility] as the nation moves through late Summer and Fall. The linguistics are showing that something of a [national obsession] will emerge around the linked ideas of [taxes] and [debt]. Though this meme also expresses across the GlobalPop entity, it is more a complement or reciprocal of what will be experienced here in the USofA. The national dialog is indicated to [fixate] on the [taxes/debt/loss_of_money] meme beginning in Fall as part of the actual [loss of money] to be experienced then, and then the language around the whole subject of [taxes and debt] is indicated to continue at very significant levels for at least a 10/ten year period. These linguistics are stacking up as a large expression of the [transformation] meta data layer which will be biting the planetary butt from October onward for a number of decades.

Markets - Marklettes, [Cherche la femme](#), Teetering

The Markets entity is understandably confusing in the picture being presented as modelspace is progressed over [summer] and into [fall] of 2008. The confusion results from that same state of [confusion] within the minds of the participants as they all [grapple for understanding] of current events. This is reflected in the language manifesting now in the global mediastream on the subjects of [dollar], [usofa economy], and [equities] among others in the [markets] context. The language that is currently on display within the global media stream has been forecast by the ALTA reports for these last 4/four or so years.

As we look to our linguistic clues buried deep in the 'shifting patterns' exposed by our processing, we find that this [fall] is dominating the Markets entity in a manner that is clearly *not* good for [equities]. The [sick/ill dollar] is still a concern, but what appears as the primary emotional driver over [fall] will be the [equities markets]. Probably *not* a good sign. The primary supporting aspect/attribute set for [equities markets] is [needing a helping hand/lift up]. Further this is a [global phenomena] and is further described as the [equalizer/return_to_mean] wave which will [alter] the [planetary/global social

order/arrangement]. The data accrual patterns suggest that the [helping hand needed/required] *will* be offered, but the patterns also suggest that [shock] will arise within the [populace] over the [arrangement offered].

The context of [markets] is also indicating that the dominating aspect/attributes for [fall] will be [coins] and [piles (of) materials]. The aspect/attribute supporting sets include [riches] and [wealth] which are pointing to the [transformation] of the [concept of wealth] from [wads of paper] to [piles of materials/piles of coins]. This area is pointing to the [mental change] which is underway now within the global population, and that by [fall] this [perception/value view] will be [digging in] or [entrenching] such that [paper debt markets] will be reduced to [marklettes/market_lite] as [all the real action] shifts into [commodities] and [production/creation capabilities]. This last can also be interpreted as [skill sets/knowledge] which can be used to [produce necessary goods/materials].

Deeper within the data accruing for [fall 2008] includes bespoke references for a [worse/bad fall] after a [bad summer]. The Markets entity growth patterns are indicating that the [state of degradation] which [settles in] over [summer] will be *only* a prelude/introduction to the [coming moods] of [fall]. Much of the data sets for the [paper markets/debt markets] context accruing now from the [shorter term] and [longer term] values are supported by 2/two large sub sets of [politics] and [military]. These can be taken as the expressive points of the American Empire, which *used* to be sustained by the [dollar], but now that the currency has reached the end of its life span, including massive, global life support efforts, the 'fortunes' of the [american empire] over [summer] and into [fall] shift to reliance on [politics] and [military]. Unfortunately for the [american empire] and [the powers that be], this is like a 3/three legged stool which has just lost a leg, leaving the user to teeter on the remaining 2/two. And these legs are not that sound as the current state of [political savvy] is of a grossly degraded form with only a single focus, that of [force/coercion/threats], and now that the Bush cabal has demonstrated that the 'greatest military in the world' is incapable of fulfilling its assigned task of keeping the Iraqi oil flowing, and is itself in a [degraded state], it would seem probable that the [failures] in both the [global political agenda] and the [military expression of force] will bring about the [repudiation] of the [american empire] as a [shockingly sudden event].

As the Markets entity is moved forward into Fall, the data accrual patterns bring out yet another appearance of our [female personality] into the global media stream. While we here at HPH are still debating whether this [female personality] is a single person, or a much deeper archetype of [woman as uniter of the like mined/clan], the data sets are *still* focused on this personality. In this particular case the imagery suggests that about the time of the [handout/helping hand offered] to the [markets], the [retreats] of the [military] and the [failure of the political initiative] will bring a [burst] of the [female personality] into the global mediastream. The [visibility] aspect in this instance is supported by [climbing (up the) mountain], and [wave/movement of cooperating harmoniously]. The data sets also bring in [martial experience/martial arts] as a sub set, though it is unclear whether the [female personality] is a [martial artist], it is clear that a [martial artist house/dojo] and its [residents/members] will be [prominently featured] within the [global media stream] and its [presentation] of the [female personality]. *Please note that this is the Global Mediastream and not the corporate controlled 'mainstream media' or MSM. The MSM context shows that it will be [torn] apart internally by the [confrontation] with the [female personality]. There are some indications of a [leak] of [conflicts internal to the press/MSM], as well as indications that the [press] itself becomes part of the story by its [absence] in the [presentation] of the [female personality].

There are significant portions of the Markets entity new data sets for Fall and Winter which derive from [cultivation/agriculture] and other leading edge linguistics pointing to yet-another-round of [food price increases]. These data sets also participate in driving the emotional summations for both the

[revolution] meta data layer, as well as the [encounters with scarcity] meta data layer. The accrual patterns also clearly show that the period from October 2008, through to the end of January 2009 will be a [tumultuous time] with emotions [revolving/circling] around a [central point]. The [fall] as a linguistic construct is supported by [bad], [bad luck], [upset], [disappointment], [aged/decrepit]. There are also 2/two separate, directly held linguistic sets which are headed by [falling (of the) kingdom], and [implosion/collapse (of the) empire/hegemony]. Hmmm. Neither of these is probably going to be good for the dollar. And given the huge levels of cross links, these are probably *not* good for the Populace/USofA....

An interesting note about the Markets entity after the September equinox is that the number of cross links over to the Bushista entity decreases as the modelspace is moved through Fall. The implication is that the Bushies become *waaaay* more [isolated] than currently, and also are considered as [totally irrelevant] to the [crises] of Fall.

More significant changes, albeit as the result of the combined effects of [terra intrusion], and [perceptive change/revolution] are forecast by the Markets entity as having a very long term effect. The details suggest that during the [crises years] ahead, the [asian] {ed note: basically NON anglo/NON euro world} will be [rising] to [demand equal shares]. This concept is built upon, and derives emotional support from the [death of the dollar] linguistic sub set, and further within that sub set, itself supports the [repudiation of the dollar] meme.

As the [equal shares movement] begins to grow over this year, and starts to thrive in 2009, the projections from modelspace show that the [anglo/euro world] will struggle to [maintain life supports/lifestyles]. This [struggle] does *not* imply any success. Rather the data sets are indicating something akin to what the Cubans experienced as their Soviet Union support system collapsed. They had a loss of 80/eighty percent of their national income in just 2/two years. Our modelspace is indicating that the loss levels may be well over half that level, or greater than 40/forty percent of national monetary income levels, and the [anglo/euro economic world] will experience these over the next 5/five years or from 2009 through 2014. The sense of [loss of money] so far experienced is only a very small part of the coming wave of Fall 2008 as the [paper debt markets] are indicated to be [ripped/torn/shredded] and further [degraded] such that the 2009 label of [transformation] will be very clearly forecast by these [final changes/revealings].

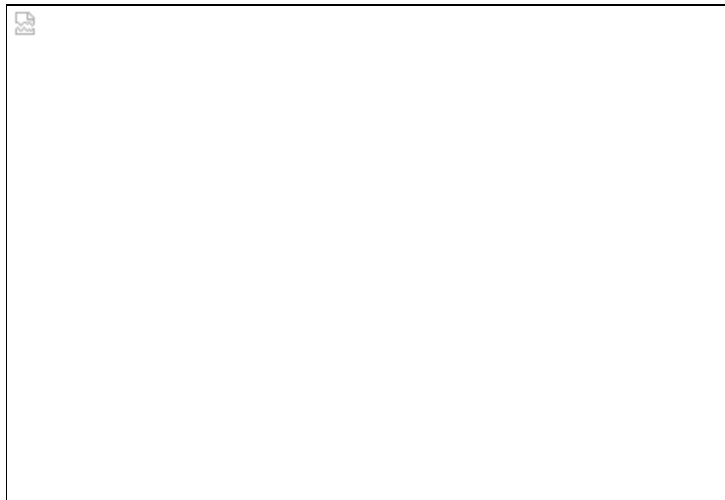

GlobalPop - Shift Happens, Equalite'

The GlobalPop entity is now introducing a new archetype for our consideration. In addition to the [female personality] referenced elsewhere in this report, we now note that a [drunken sailor] will be rising to [visibility] over the course of this [summer] and through the [calamitous] times of [fall]. This [drunken sailor] is also able to be interpreted in the more academic language of [rebellion against [normative](#) behavior]. The [drunken sailor] context has risen in apparent response to a large scale [shift/schism] which is pending at a [global/planetary social arrangement] level. This [fracturing] of the [social order] is forecast within the aspect/attribute sets of resulting in a [shift] within [normative behavior]. This [shift] will have [profound impacts] which will last multiple generations. As may be expected the [drunken sailor] linguistic set is participating in several meta data layers including [duality], [revolution], and [secrets revealed].

Within the [drunken sailor] context exists a complexity of revealed changes which include [resource sharing], [dilution/restriction on resources], as well as [redirection (of) mental construct] which can also be interpreted as [wrapping (your head) around a new/outlandish idea]. There are further internal layers and cross links within the [drunken sailor] linguistic set which go to many core level archetypes. These can include [reeling], [unable to keep balance], [can't relate to distorted world], and other, easily conjured references to [drunken behavior] and [mal functioning body parts]. It is worth noting that many of these areas are cross linked externally to the Terra entity, where *some* are

terminating in the [walk about mountain] sub set previously discussed.

Both the global [loss of money] meme, as well as the [revolution] meta data layers are rising in their impacts within modelspace as the threshold from building emotional tension into release emotional tension is crossed (see chart from last week below).

As the [revolution] meta data layer rises in emotional summation in December, there are specific geographic references for [france], and [china], as well as the [usofa]. Within these geographic reference sets, the linguistic values gained go toward [revolution], and [contempt for old order]. Note here that the [old order] which is so ill favored is the [red shield supported, global religious order/arrangement]. The data sets indicate that the [red hat pope] and his ilk will fare badly as [revolution] moves the populace in these countries. We can note specifically a combination of the horrific [loss of money] as the [economic degradation] progresses through Summer/Fall, which will [incite] the [french populace] into [rebellion/rioting]. This meme will join with the [revolution] meta data layer influences to [point to/single out/focus upon] the [gilded hands (of the) priests and popes]. This [focus on church wealth] in the midst of the [collapsing currencies] rippling through the [paper debt/credit economy] will lead to calls for [equalization/equalite' of the church property], or what will be known as a [dispensation/dispersal] of the [hoarded riches]. As may be expected, the [pope] will not like this new [social direction], especially as some of his [minions] are indicated to be [pressured] into [confessing in public] as to [hidden/occult wealth sources] that themselves will [ignite/fuel] a [fiery scandal]. Much of this [rebellion against religion] in France is indicated to manifest in a pattern of escalating internal crises over the next 9/nine years with the most intense values being gained from 2010 onward.

The problems for [china] are also indicated to be [revolutionary] in nature, but the focus of the populace will be upon their [human rights] and [civil rights]. The issue of 'democracy' versus 'totalitarianism' will not be paramount, but will be inherent in the [global civil rights movement] which will face a series of [confrontations] with the [elite of chinese leaders] over the next few years. Yet the [chinese revolution] will not be over political systems, so much as a rebellion over the [global human condition].

It also needs to be note that the longer range value sets continue to have accruals for the [global coastal event] as well as several other planet affecting natural changes which are *primary* drivers of the emotional changes for all countries over the rest of this decade and into next. These universe provided, pan solar system, galactic order cycles are featured supporters for the [transformation] label for 2009.

Also in support of the [transformation] label for 2009 are the aspect/attribute sets for a [global coastal event] which are appearing in some form or fashion in most of the major entities. As the GlobalPop entity progresses into the longer

term data sets within modelspace, the entity gains aspect/attribute sets around the idea of a [3/three year effect/alteration]. This data set within the GlobalPop entity is supported at the primary level by [oceans], and [coasts], as well as having detail level sets going to [harbors], [bays], [estuaries], and other [coastal/littoral] descriptors. The [3/three years effect] aspect/attribute set has descriptors for [waters] at many levels, and includes all types of waters from [deep ocean] to [coastal] to [brackish/estuarine] to [drinking] and [waste] types of [water]. The [water] references are supported at the primary level by aspect/attribute sets which are internally linked back over to the higher level [3/three year impact/change], and include [climbing (a) high hill (for) vantage point (of the) changes], and [visible alterations]. Both of these supporting sets include directly held aspect/attribute sets for [land (form)/terrain changes], and both are extensively cross linked to the Terra entity. Within the [3/three years changes impact] aspect set there are supporting details which would *seem* to suggest that a [height/level of water] issue comes into very high [visibility] within the global mediastream with discussions about the [rise] of the [levels]. At this point there are 2/two possible interpretation paths for some of the aspect/attributes in support of the [3/three years (of) alterations/changes]. Either we are getting descriptors for a [change process] which takes place over [3/three years] resulting in [land transforming water level rise], *or* we could/maybe be getting descriptors for a [rise in water levels] such that for [3/three years following (there are) no further increases]. This last is the alternative side of the interpretation and suggests an [all at once] kind of event, and then a period of quiescence with little noticeable change. In either case, the [oceans] will be providing a very significant portion of the global mediastream verbiage about Terra in 2009.

The GlobalPop entity shows that the [transformation] in [social order] initiated by the [oceans/coastal events] in 2009 will lead most immediately to a very [large scale/planetary] impact on [movements], with the emphasis on [restrictions on movement] which produce [isolation (of) communities]. Further there are [diaspora] supporting sub sets which go to the imagery of [refugees] who will be [scattered] into diverse [groups/communities] globally as they are [forced/trapped] by the [progression/manifestation of oceanic circumstances].

Conclusion - Part Three : Labels, Stones, Bones

Understandably, we here at HPH are more focused on the biospheric changes under way than the economic degradation which continues apace of forecasts. While the economic degradation, and the death of the dollar will affect billions of people, the biospheric degradation affects all life on earth. The combination of many differing inputs including both our data sets, and recent manifestations on the planet are providing a view with some evidential support for a pending 'oceanic disturbance'. We have labeled the [oceanic disturbance] as our [global coastal event]. We need to note that the interpretation of the current data set can lean to either an 'event' with subsequent multiple years of [adjustment/impacts], *or* it could be that our appellation of 'event' is a misnomer, and really we are facing a multiple year process. We note that either way, big damn changes are forecast, which will directly touch billions of lives, both human and others, over these next few years.

That we find repeated indications in the data pointing to [transformation] both of the planetary biosphere, and then necessarily the life which is part of that biosphere, is disconcerting, especially in light of the recent manifestations of large scale biospheric impact such as the Chilean/Andean volcano's, the great earthquake in China, and the forecast, now materialized, [traumatic winds] both here in the USofA and in Myanmar. The developing circumstances within our solar system, and especially within the collective human view of planet earth are now seemingly presenting patterns which both indicate and confirm that large scale changes are underway.

We gnaw on language here. The gnawing allows to not only receive the language as communications, but to examine it from other perspectives, such as

an educated eye might be applied to a bit of hand made furniture in such a way as to reveal the skills of the personality which did the crafting. Such an educated eye might be able to discern qualities of tool usage which speak to a particular lineage of instruction including locations in time and space, and thus, the history of the period affecting both the personality, and the crafted item. The educated eye of the aware observer can pull such information out of the patterns of reality which present themselves, however to the casual observer, it is merely a chest-o-drawers. For us, our furniture is the language out-and-about. Through the patterns revealed in how language is employed as a tool, we can make educated guesses about the past, as well as the future, by the archetypes presented, albeit obscurely sometimes, in the language employed. So as archeological linguists, we track down entomologic patterns of words seeking the base from which the use rises as this provides the 'clue trail' leading to present day use, and the hidden predictors for the future. Thus at our core, the most base archetypes begin with [human body parts and processes]. From there, everything else spreads. But, given the evolution of language over time, and the clutter of transitioning words/phrases, the educated eye must be very diligently applied to discern whether a reference to a 'stone' is leading to the context of 'stone-hard-enduring...', or to the context of 'stone - pit - nuts - balls -courage'. It can be confusing. And tedious to examine linguistic structures for possible 'fits' with the lexicon. Then, of course, there is always the human tendency to stop with the first solution to a problem. And with language there are sooooo many possible paths, and the bastard generations just coming up are constantly creating new slang which increases the possibilities needing to be examined.

Then, even if a probable understanding shows up, there is always the validation of that educated guess against the manifesting reality crashing around us just outside this digital space. It is really scary is when the circumstances out-and-about seemingly support the more outrageous of our predictive clues.

Such was the situation with our 'quake warning' which went out mere days before the great quake in China. Now our next set of concerns will be with the continuing [traumatic winds] which will deliver another very violent hurricane to the USofA/North America, and further to the potential that our [global coastal event] will actually materialize sometime in 2009. While we have data accrual patterns pointing toward the end of Winter, so just around the March equinox, 2009, as the likely event horizon, the linguistics can be really deceptive. IF, as an example, there were the acknowledgement over Winter that a 'global coastal event' was pending, however remotely, and then there was a high degree of visibility of the subject within the global media stream, then we would also be getting the same sorts of data sets and patterns which are now populating modelspace. Basically we cannot discern if the global populace is talking about a [global coastal event] because of being driven by media speculation, or if such an event occurs. Further complicating our work is that our modelspace is not static and changes with the data processing over time. So each week brings new linguistic structures which must be fitted into the entities and existing structures relative to their timing clues, and emotional summations across a wide array of values. It was this week's processing which has added the [3/three years impact] dimension to the already confusing clues around the global coastal event. Given our granularity at the longer range value set, we cannot discern just what takes 3/three years, and have no clues at this point to applying the 3/three years to either the duration of the event, or to the 'recovery'. However, noting the state of 'recovery' in the area hit by Katrina/Rita hurricanes over 2/two years ago, it would seem very unlikely that the planet could recover from a global coastal event in a mere 3/three years. Applying this logic then points toward an interpretation that the event itself will be more 'process' in the human mind, and will span 3/three years. This also seems to fit with the longer range emotional tension values as the majority of the next few years are spent in 'release language' periods, many both very long and without interruption by building emotional tension patterns.

In future times, or so the data suggests, humans will wish to memorialize these current days with monuments. The real question pondered here, is whether the

monuments will be for our 'stones/courage'? Not that any of us are likely to care much for monuments while living through (or not) the events, rather our thoughts will probably be with our bones, and not future stones.
