Part 1 - Section 1 - Meta-Data Notes, Terra - West Coast North America  
Transformation

Asymmetric Language Trend Analysis Intelligence Report

‘Changes in language precede changes in behavior.’

By Tenax SE for HalfPastHuman.com

Note this report is offered for entertainment value only. Any resemblance between the events portrayed in this report and any developing reality is purely co-incidental and in no manner represents foreknowledge on the part of the authors of this report.

Note that this information is derived from humans expressing themselves on the internet. As such, human emotional values and the words used to express them are being sampled and interpreted here, NOT THE FUTURE. Any resemblance between this report and future developments is entirely in the mind of the perceiver and does not exist in reality. The Authors cannot be held liable for accuracy of lack thereof in this report. Authors cannot be held liable for human interpretation of this report nor any action any human takes as a result of this report. Any human foolish enough to alter their behavior based on this entertainment-only analysis demonstrates themselves incapable of rational appreciation of reality, and the authors are explicitly held harmless and blameless for any and all such mental aberrations on the part of the reader.

03.10.2005 Meta-Data Notes, Terra - West Coast North America  
Transformation

Note: Entities are identified by a blue typeface. Aspect words are enclosed in square brackets []. Attribute words/phrases are within parentheses (). Interpretive editorial comments are preceded by an asterisk \*.

Data set distilled from 18.9 million reads. It is anticipated that processing will bring in another 34 million reads (more or less) over the course of the run. The resulting interpretations will be posted as completed. At this point, we are anticipating 5 installments to this report.

## Meta-Data Notes

Our first ever run on this technology was on a data set gathered between February 10, and March 15th of 1997. This run yielded a total of 15 million reads. Over 93% were english language. It was a pivotal point in the development of the process though, in that the results were totally unexpected. We had developed a postulate, to wit that the aggregate 'emotional context' of the language being picked up could accurately predict the 'emotional response' of the actions of any aggregate group of humans of a large enough size. That is, we postulated that the emotional 'read' of a large enough group of 'conversations' could, in advance, inform us of movements made in the stock markets of the USofA. Further, that would be a specific test case of the more general theory that large groups of humans 'telegraph' the sum of their reactions within certain time periods and in subtle, but measurable ways. In effect, this idea was only slightly different from polling for opinion. In our case, we were 'aiming' the technology at detecting shifts in attitudes about stocks/equities.

Our postulate had it that the conscious expression of opinion was both frequently at odds with the actual actions of the groups involved in subsequent circumstance, but also was heavily influenced by the phrasing of the questions. In point of fact, the question determined the answer on conscious polling. Our approach was to try to do the polling of the subconscious mind without the subjects of the poll participating. And further, we were to start with the idea of letting the groups being 'stealth polled' determine the subjects about which we would ask questions.

On that first run the idea was really to grab a base-line registry of emotive changes over a brief time as such changes were tied to expressions of languages. This base-line was to be used as a reference marker in further runs over the course of that year.

Bearing in mind the context of 1997 as the rise of the equities/money bubble to the point of 'irrational exuberance', we naturally expected to find vast quantities of conversations on all things fiscal. We were correct, but that first run provided a real shock as well.

A totally unexpected result had to do with the existence of a significant number of the individual reads being segments of conversations about what we now can characterize as 'earth changes' or 'global catastrophic climate change'. This was a shock at the time as the subject was not in vogue, nor really even on the horizon of the mass of people. It arose around the word 'sun' where we had a whole series of errors in processing until we determined that the cause was a dichotomy of two subjects sharing the same word and radically different emotive directions. The smaller of the two groups was discussing SUN, the computer network/tech company (our intended target word), however a much larger group of conversations were referencing the 'sun' as in the star central to our solar system. This was unexpected to say the least. The first immediate result was the devotion of the rest of the year to the other steps in the processing which allow us to separate out the various subjects. It also led to the acquisition of the Oxford English Dictionary list of words from which we developed today's lexicon base. This unexpected discovery in 1997 led to our current development directly. It also pointed out, even then, that something odd was occurring such that humans, as receptors of signals, both subtle and gross, were beginning to voice their concerns about the state of the health of planet earth.

Such concerns have been vindicated most spectacularly in recent months and have further gone toward validating our premise of the nature of the 'human antennae' and pending change.

Toward that end we note in this run that a very large number of data elements are rising, perhaps toward the point of 'significance' wherein these elements are used internally by humans in their intuitive decision making process. A small table is provided:

<i>Year</i>	<i>Lexicon for earth changes</i>	<i>Emotive Sum expressed as per cent of total emotive values obtained in the run</i>
19	sun, weather, climate, earthquakes, flooding for a total of 104 descriptors	11%

9		
7		
2	sun, weather, solar abnormalities, climate	48% (data acquisition still on going - preliminary values)
0	change, Planet X, UFO, earthquakes, tsunami,	
0	flooding, volcanoes, and so on for a total of	
5	over 1400 descriptors	

Within the evolution of our technology we would naturally expect to get better at picking up descriptors and their common associative values, so one way to look at it would be to assume that changes within the lexicon spoke to an improvement of our programs' abilities. However, as we have noted other improvements appearing, these do not seem to alter the output ratios. And as our output ratios are indeed scaling dramatically, and as reality is indeed intruding with manifestation of earth changes, it would appear that a basic trend has emerged. What was a shock in 1997, that is, the whole subject of 'sudden global catastrophic climate change' and that it occupied an astounding 11% of our data run's total emotional sum values, has become very much 'main stream' within our data set in 2005.

In this run, as in the last, our data set shows a few significant changes of proportion. That is, as an instance, the words associated with the idea of UFO's has taken a very large jump up. We have a rising percentage of the emotional values coupled with a rising percentage in total words devoted to the subject.

It is true that we have made two significant changes in the processing for this run. The first is the addition of thousands of non-english, non-roman alphabet words to our lexicon with some first cuts at emotive valuations. Second, we are introducing a new element into the processing in which we track the lexical progression that accompanies the emotive sum progression within the modelspace. This hopefully will provide a new and useful degree of granularity. However, while the first of these changes did increase the number of words within our lexicon which are all associated as 'earth change descriptors', it did so only by some 183 words. In some cases we also added direct english corresponding transliterations. An instance is a single word which translates to english

as 'earth noises'. In such case, we also include 'earth noise' as an attribute within our processing set so that we hopefully have increased our ability to 'catch the phrase'. Such changes are bound to increase the totals of emotive captures relating to the subject. Even so, it does not appear, so far in this run, that the increase has significantly altered the outcome. In our testing prior to activation, we increased over all emotional weighting on the subject only by 1 per cent.

So, that having been noted, we still have to come to terms with the much expanded emotive associations with the whole subject of 'earth changes'. Based on our lexicon of descriptors and their emotive impact values, a better appellation is 'Sudden Catastrophic Global Climate Change' or SCGCC. In this sense, 'earth changes' implies neither immediacy of impact nor necessarily, the component of potential for devastating alteration of the human environment.

The expanded number of elements within the lexicon which are associated with the subject of Sudden Catastrophic Global Climate Change have obviously increased the total percentage of weight that the subject will occupy within our data sample. However we note that such phenomenal world manifestations as the tsunami have had a too-be-expected impact of increasing the total number of conversations about the subject. So we would expect the increase in percentage even if we had not had the expanded lexicon. Further, the total number of reads picking up one or more of the descriptors involved in SCGCC from sources NOT focused on earth changes or any of the descriptors has increased nearly 9 fold over the last two runs. That is to say, earth changes discussions are happening much more frequently in places like scrapbooking forums, or sewing forums, or gardening forums (though might expect this last one). We also have seen over a 20 fold increase in such descriptors showing up in financial or 'investment' fora. So the impact of the Sudden Catastrophic Global Climate Change concept is permeating very large areas of public discourse.

Further we have to accept that our lexicon can no longer be as neatly categorized and that such things as the whole of the UFO subject are now inextricably bound to Sudden Catastrophic Global Climate Change. To a certain extent, there has always been lexical links between UFO's

and such earth events as volcanoes, this especially true in Central and South America as well as the regions of the Southern Pacific. Now however, we find that these words are associated globally with all manner of geo-events including the large scale fog covering over 89,000 square kilometers in China, the appearance of snows on the Arabian Peninsula, and of course, the Tsunami of 2004. We also find them associated with earthquakes in Iran, with Siberian volcanoes, and recently a rash of sightings among the coastal and mountain communities of British Columbia, Canada. This has to be noted in juxtaposition with the recent poofing of Mount St. Helens, as well as the thousands of earthquakes linked to plate boundary activity off the coast of Washington state and the province of British Columbia.

Since we find that the complete reads we obtain frequently will have references to both UFOs and Sudden Catastrophic Global Climate Change, we now 'grow' our lexicon to include the emotive values linked to the words associated with UFOs. This gives us a broader base from which to define our 'emotive set' with which we work in obtaining our interpretations.

The point of raising the whole subject of UFO's is that the percentage of the emotive sums associated with Sudden Catastrophic Global Climate Change and UFOs as a primary aspect is risen significantly.

All of last years runs had a basic 'theme' running through the Terra entity interpretations of bad fortune related to or caused by water. This theme was a consistent and in the end, a reliable indicator that indeed, there were to be bad problems caused by water. Well, so far in this year's data acquisition, we now find a significant, though minor, theme of UFO's rising within our data sets. If last years' performance is an indicator for this years' performance, then we can expect UFO's to be the 'theme' or major sub-plot of the year. At least as seen in the data acquisition so far. Now we note that official government stooges have spent years of effort to dis-info the whole subject, and to place labels of ridicule on anyone asking any sorts of intelligent questions about the subject, such that it has become a more or less taboo concept for examination, however, any belief, or opinions on the subject aside, it is certain that our data is showing links between reports of UFO's and subsequent geo-events.

Since the government ridicule and lie campaign (Operation Blue Book) and the subsequent disinformation monitors have polluted the subject with contrived emotional baggage, we choose to NOT have UFO's as an entity, though there is certainly the mass to justify such an interpretation. Instead we will reference them as a primary aspect of the Terra entity. So believe in them as you choose, but note that the reports of wide spread sightings are now a pretty damn good indicator that the area will soon experience a geo-event.

We also need to note that the total number of references to sightings of UFOs has risen in all media and quite significantly over the last half of last year, and so far to date. We note that last years totals for the whole of the April run showed less than a third of the references we find so far in this run. A very significant change.

Terra - West Coast North America Transformation

As may be expected, following the loss of life in the tsunami of 2004, that we would and do, find a very large per centage of the total reads are now discussing some aspect of the Terra entity, with most of the conversations revolving around the idea of Sudden Catastrophic Global Climate Change and whether or not it is real, or here. Basically a large escalation of both discussions, and emotions around the idea of environment in a very local, and personal level of connotation.

West Coast North America Transformation - A transformation is seen for the west coast of the North America which will center on [rhythmic](motion) which has attributes suggesting that the 'rhythmic motion' will (compel)[breath] and [stimulate] [growth]. Further it would appear that the [plate] {we are assuming the Juan de Fuca plate} in a [low][position] will (leap) [forward] in [one/1] (great) [step]. The suggestion is it will [step] to the 'east' as we have [time] (rises) [fortuitously] and as 'time' rises in the east with the sun, we will assume that for our interpretation. Further in that vein we find that the [step] will (prove) [fortunate] in that [many/most/large number] will be (rolled) from their [beds] and will find that the [step] of the [plate] has (removed) [participation/involvement] in (major)[affairs] from their [days/weeks/passage of time]. The interpretation is for a pre-working

day 'step' of the plate, and resulting earthquake to pretty much make everyone affected forget about work for the day.

There is a lot within the reads so far to suggest that this particular geo-event is connected to the ALTA 105 report in which Terra was seen 'rising to exhaustion'. In this run, we now find that the [step] of the [plate] has a primary aspect of [created/new/manifested/made] [ground/earth/mass] and that this 'created mass' will take a (rest) after the [step] of the [plate] but then will resume its [energetic][creation] such that [waters/marsh] will (slosh) over their [containers/banks] and will (cover) the [feet] of those (fleeing). The obvious interpretation arises as, pun intended, so apparently does Mount Endeavor, the sea-mount/volcano off the coast of BC/Washington, and it would seem that some significant underwater growth, likely with associated earthquakes, will 'slosh' water into the low lying coastal areas of BC and Washington state. Supporting this idea, we find that [seals/sea lions/marine mammals] will be seen (walking) in the [middle] of [town] and (resting) on [hills] some [distance] from the [waters] as they (recede). Also we find that the [capitol] will be affected {presumably either the Washington state or BC province capitol} such that [shellfish] (litter) the [stairs] and [seats] of (power).

Further, the data suggests that this [step] of the [plate] will control [weather] for some immediate time thereafter. We find that aspects of [crust] of the [earth] (splits) [open] like a [soaked/full/waterlogged][seed], and that the (pulsating) (reverberation/motion) of [thunder] (under) the [mountain] (shakes) the [fertile][valleys] the following [inundation] covers the [vegetation/crops/croplands] upon which [men](feed). In fact, a large number of the cross links with the [step] of the [plate] are related to [food], either production or distribution. Another primary sub-aspect of the food associated cross links comes from the Populace entity and its primary aspect is (hunting/locating/finding) [food]. Within these cross links, and held by the Terra entity, are a number of sub-aspects which go to the idea of (seeking) [nourishment] (amidst)[ruin]. And the [ruin] has a complete descriptor set giving the image of 'debris left behind by the retreating sea covers all'.

Again, as has been noted in the ALTA 105 report, the Terra entity is dominating all others, unlike years prior to 2004. In the earlier runs we noted over the course of several years the gradual rise of the Terra entity to prominence over all other entities, but since mid 2004 (prior to the geo-events of that year) we noted the dominance of the Terra entity with cross links into all other entities within modelspace. The most recent changes in this regard are for an increase in the number of such links and now, with the 2005 data gathering for ALTA's 105 and this report, the Terra entities cross linked aspects now are all prime relative to the entities in which they link. That is, the aspects of the Terra entity which are cross linked back to other entities are all now dominant on their emotional sums for both impact, duration, and immediacy (the totality of emotional range captured at the aspect level).

The Terra entity in this data run also shows a change in the attribute set hanging off of the aspect of [earthquakes]. Whereas there has always been a certain level of emotional trepidation associated with the [earthquake] aspect, we now find that a large, and largely new attribute set is 'clumping' around this aspect. We find that attributes are suggesting that earthquakes will (become) [common] as (breath/breathing/inhalation) over this [spring], specifically focused on the season of [spring] and therefore seen as our first good timing clue, that is, the equinox March 21-23. While there are direct links to the [step] of the [plate] with the primary aspect of [earthquakes], we do not find an 'order of appearance' indicator within the data as of this point in the processing.

Now we also need to note that there is a significant amount of conscious participation in the 'worry' part of conversations, and since the 2004 tsunami, people are operating at a higher level of daily tension, especially as regards anything related to earthquakes or tsunami or sudden earth change, so it is probable that such conscious worries have intruded to some extent on our data collections in 2005. This being noted, we still are mindful of thousands of quakes off the coast of Washington/BC in only a matter of days, and the recent St. Helens activity, so....we are going to post this early part of the report today, with the remaining, to be

called Part 1- Section 2, to be posted as of Monday on our pre-set schedule.

Also note that should anything in the way of a significant quake happen in the PNW area, we will likely be out of communications for a period. This was the state of things for large parts of Puget Sound following the 2001 6.8 quake. No reason to suppose that a larger geo-event would be less impacting. Should any such event take place, AND we maintain internet connectivity, then we will set up a reportorial section at the main Halfpasthuman.com page.

While we have no indication of timing, with the recent PNW geo-events, we are all feeling a little 'shakey' as regards to the solidity of our footing. This posting is responding to that jitteriness, rather than any idea of immediate events. We expect Section 2 to be posted by noon, PST, Monday, the 14th.

Data set distilled from 18.9 million reads. It is anticipated that processing will bring in another 34 million reads (more or less) over the course of the run. The resulting interpretations will be posted as completed. At this point, we are anticipating 5 installments to this report.

Terra - Continued - Tides of Quakes, Two Mountains of People, Oil - Restricted Movement, West Coast - Winds, Antarctica - Inner Fire, Eclipse - Broken Bones

Tides of Quakes - Associated with the references to the spring equinox {which is one of 9 main timing clues} we find several aspects whose cross linked attribute sets are also cross linked back to the Populace entity where they emerge to the aspect of [tides] with primary attributes of (wave). What is curious on the Terra side of the cross links is that these attribute sets {three of which are primary} all go toward earthquakes. One interpretation could be that the perception on the part of humans will be that earthquakes this year arrive as do the 'tides', that is with regularity, and under celestial influences. In any event, the data sets are chock full of references to earthquakes, both small and large. In a continuation of the idea from ALTA 105 we do see that earthquakes will be an 'environment dominant' feature of life in 2005. Further, in this report we find that now clusters of lexical structures are resolving both within the Terra entity and within the Populace entity which clearly suggest that large scale loss of property will occur as a result of earthquakes. Perhaps not a good year to be in the insurance business. Further, the geographic clues suggest that the loss of property will be most severe in the USofA, and South America with Central Asia and China following close behind. In many cases there are extensive cross links from the areas within the Populace entity with the most number of both lexical values and their sums, which reference property loss, and the Terra entity earthquake entries, however, the curious part is this section of the Terra entity is referencing the earthquakes under an aspect of [small]. But, the surprising development of explicit references to

property losses should not be minimized even if it will be lots of small earthquakes which will cause it.

Also cross linked back to the Terra entity are several links to the Markets {both fiscal and governmental}, see below. Apparently the continuing problems with planetary structural stability contribute in no small way to market and governmental problems this year. Indeed it would appear that something of a crisis will appear shortly after the spring equinox in which response to Terra activities will get center stage but also will be seen, perhaps through the eyes of the press rebellion noted in ALTA 105, that the 'scientists' are being (trotted/paraded/stepped) out as [priests] and [sorcerers] merely to [provide](reassurance/comfort) to the Populace over developing geo-events. This incident or period, possibly as long as a week from the few timing clues we have, is seen as being filled to the brim with constant [bluster] and [rage] against the (mountain) while the [officials] (cower) under the [cover/concealment] of their [privilege]. From the cross links to the Populace entity, as we progress the modelspace, we note that the proffering's of the powerful will [not] be (accepted/taken/ingested) and will instead lead to (acts/behavior/expressions) of [public](humiliation).

The Terra entity has cross links to the Market entity in many areas, but one in particular suggests that somehow the geo-events will effectively [remove](tools) from our (economic) (equation). The references to (tools) as an attribute, contain sub aspects indicating of both real tools as in machine tools, logging equipment, et al, but also accounting tools, including 'functional allocation'. This blending of categories is perhaps indicative of both damage to both real and fiscal accounting property. Perhaps the disruption of data acquisition through communications disruptions which in turn leads to the 'removal' of an accounting tool.

A further, and most significant { in our opinion as interpreters } cross link goes from the Terra entity over to the Markets entity at the point of the Markets entity primary aspect, [confusion]. Much more of the connection will be meaningful after reading the Markets entity

description below, but at this point what is of interest is that the Terra entity has, directly secondary to its [earthquakes] aspect, the emerging aspect of [confusion] as well. An emerging aspect is one which comes from the changes as the modelspace is progressed to include the changes captured within the data sets. So in this case, the [earthquakes] aspect is initially without the references to a sub-aspect of [confusion], but within the progression of the data, acquires this aspect, and its fully populated attribute set.

In speaking of the attribute set, we note that this is NOT the same set as populates the [confusion] aspect within the market entity even though they are indeed cross linked extensively and do share many of the same elements within their discrete attribute sets. In this attribute set we find that the [confusion], while relating to property loss, is also concerned with many of the issues that might beset 'earthquake refugees' such as [clean] (water), (bedding), and [food](sources), et al. So the image at this stage of the [confusion] link is one of the state of confusion that would directly afflict a once-urban population following a debilitating series of earthquakes. Again, the indication here is for [small] to be predominant, as far as the earthquakes go, but also somehow to be damaging of significant amounts of property. And to cause a large population to become refugees in their own [backyards/property].

## Two Mountains of People

We still have, within the Terra entity and cross linked back over to the Populace entity as well as peripherally to the Markets entity, the lexical structure indicating that (two)[mountains] of (people) are going to experience (disruption) this year, and the current data shows a clear link with the spring equinox. This link is more of a time marker, as in this is viewed as happening after the equinox, but how much after is not suggested. What still shows is the [risk] as a primary aspect to this sub-element of the Terra entity. The [risk] that faces these two [mountains] of (people) arise from the Terra entity, and as such are seen as 'natural disasters'. In this data run we have the idea that these two cities will

[stop] suddenly. As though the [mountain] (in)(motion/action/movement) will [stop](abruptly/suddenly), and (be) at [rest].

From cross links to the Populace entity, we note that the [stop] will cause (panic), but it is unclear how this [stop] will cause property damage. The geo-events which are indicated to be placing the [risk] in the situation are apparently not earthquake related as they show up as independent lexical structures with only some small internal cross linking to the earthquake area of the Terra entity.

What is shown is that the [stop] places the [risk] due to (separation) of the [spine] of the (mountain/city). An (excitation) arises which impacts a [blockade] which in turn affects the [mountain]'s (heartbeat/pulse/activity). It is this latter that is the connection to the [risk] and may indicate the sudden inability to obtain energy or other supplies which forces the evacuation of these cities. There are many references to [abandonment] and far fewer to [destruction], though, what a ratio of such concepts should be is anyone's guess.

We do note that the 'situation' of the two cities within the Terra entity is cross linked back over to the Populace entity at very primal emotive levels such as [fear]. This, and other indicators suggest that the emotional response to the [stop] of the two cities will be widespread and widely felt.

We have few direct geographic clues to the locations of the cities, and most of these are relating to [sunset] on [mountain](range), and (rising) [light] on [mountain](ridges), and [summit] (view) of [valleys] at [midday], and such others. All of these basically go toward the idea of mountain ranges. Rather than being taken as allegoric references to cities as mountain ranges exclusively, we need to be aware that the sections of the Terra entity relating to the (refugees) also have some small number of attribute sets suggesting that at least some refugees will (walk)(out) over [mountain] (summits). Further, there are others suggesting that

whole 'villages' will emerge from [tents/temporary] [residence/housing] in [mountainous/alpine] (valley).

Within the cross linked areas of the Populace entity we do note that while the [structure/body/corpse] of the [government/prefecture/administration] of the [mountains/cities] will (separate/dissolve), that all is not anarchy. Apparently while the [administration/ministers] are busy (dithering) in [halls], the [torso/body/body politic] will (walk/climb) to [relief] in the (hills) and (watch) as the (head) (falls). Back in the cross links of the Terra entity, the same [mountains/hills/foothills] are seen as providing [encampments] and (stability). While this (stability) is obtained for the people, there are indications that [airplane] traffic is disrupted, as is the possibility of air based relief.

As noted with the Tides of Earthquakes above, there are indications of a rhythmic basis for the geo-events. We find references indicating that the [sun] will be the controller of the earthquakes in an [energetic] fashion which suggests directly that energies from the sun will act as triggers to the geo-activities of the coming spring. It is also note worthy that not only is there an eclipse on April 8th, but that references to the eclipse were captured in our data gathering and survived the filtering process. Further this eclipse is both full, and partial depending on location of viewing, but of note is that the entire west coast of North America has the eclipse as full. As this eclipse is lunar, it is of a necessity a synergy alignment which always generate larger tides, and can be linked to earthquake activity. With the strange fireballs flying over the west coast last night (March 12th, 2005), and the nearly simultaneous earthquake, fireball, and bizarre BOOM, here in Olympia Washington, we can be forgiven for a more than slight paranoia about where such nasties as large earthquakes might happen next. As the Sumatra earthquake and tsunami were preceded by fireballs and BOOMs over Jakarta, a pattern might be indicated which would suggest that a [step] of the [plate] locally might be imminent.

Our few timing clues about the geo-events relate more to duration, than time of appearance. We can say that the [small] [earthquakes] which will seem to dominate, will seem to come in [three/3] day periods. There apparently will also be some period of rest between these 3 day shakes.

## Oil - Restricted Movement

Curiously, within the Terra entity, we note a complete primary and secondary aspect relating to the [restricted] [movement] of oil. Within the lexicon it is not the oil transportation which is seen as being restricted, but rather the (flexible)[roots/pipes] which will be [cut off/separated/sheared off] and thus the movement of oil restricted. The image is further amplified by references to [tabletops] (separated) from (legs), and [settling](down) of the (earth/ground/soil) is [dangerous] and will be (announced) as the [coast] [shifts]. This relative to the coast, and other suggestions such as [geese] and other [wild](birds) (live) on [top] [plateaus] and [barren][plains] (overlooking) the [coast], would seem to indicate that the Gulf coast is likely NOT being referenced, but other than that, areas of off shore oil production which can be overlooked by a [rookery] which is topped by a [barren] [plateau] in which a [drying] [wetland] sits, are seemingly at risk for a settlement issue arising which will shear off their pipelines.

## West Coast - Winds

We also note that within the Terra entity, specifically focused on the West Coast of North America, a primary aspect of [winds] as the new driver for weather related problems. The indications are for ten periods of large wind storms followed by periods of (disquieting/disharmonious/disconcerting/agitating) [calm]. While there is much to suggest that California gets the brunt of the storms, the overall geographic references are for the West Coast as a whole. We also note that the storms will be so (sustained) as to (move/relocate/shift)[boulders] on cliffs and beaches. There are cross links internal to the Terra entity which go to the [sun] being the driving

force behind these from the [Pacific] wind storms or periods. Further cross links out to the Populace entity suggest that [communications] will be disrupted as a result of the storms. While there are some small indications that rain will play a part in these storms, these are only for the end of the period, and on the whole the storms will apparently be remembered for the wind, and not rain impacts.

### Antarctica - Inner Fire

Within the geographic specific references which survive the processing we again have a large lexical structure centered around Antarctica. In this case, we have specific references for the [inner] [fire] (heating) up. Of course, a suggestion that perhaps volcanic activity could arise there. Antarctica has a number of volcanoes and some off shore in near proximity so eruptions are not totally out of the ordinary. However, our defining attribute set within this run suggests that the heating up of Antarctica's [inner fire] will cause a [change/shift/alteration] of the [face] of the continent. Further the lexical suggestion is that glaciers will be [broken] and that [lakes] will be (spilt out/emptied/shaken out) to the sea.

We have a few further descriptors for the event which indicate that the sound will be heard over a very large area of the planet, and that [mountains] of (pure)(condensed)[water] will be [vaporized] and (transformed) into [atmosphere] such that the [fog] will (cover) the [southern ocean]. One of the other descriptors suggests that the [lid] on the [inner] [fire] is (weighed) (down) by [ice] and thus this would indicate a land based volcano. In any event the eruption is to be felt some considerable distance away, and will (bring) [blood] to the [cheeks] {presumably of the face} and [knock down/topple] people onto their [bellies].

Within the modelspace, when progressed, the Antarctica references change considerably, and shift over to aspects dominated by [weather], [rain], and [thunder]. Unfortunately, there are still considerable attributes

for [violent] weather, and curiously, a whole lexical structure for [released](violently) from [knots]. Within this we find further internally cross linked aspects at lower levels which go to the idea of very violent rain storms which release either ice or earth slides on the southern continent. The image suggests that it will be relatively calm, and [evenflowing] after a very violent, rain driven release. In one sense this would seem to fit large amounts of water being ejected via steam in the area. Would such rain cause large scale glacial movement?

### Eclipse - Broken Bones

An unusual occurrence given our filtering techniques, we nonetheless have some few dozens of lexical structures devoted to the April 8th {presumably} eclipse. Also odd is the phrasing relative to the eclipse passage, as we find that [surrounded] by [twilight] leads to [broken bones], while another, separately arising aspect/attribute set has [surrounded] by [darkness] leads to (actions) and (conflict) in the [earth/ground].

The annular path of the eclipse would place Australia and points south as being in the [twilight] of a partial eclipse while the 'lucky' west coast of North America is under the effects of the full eclipse.

### Markets/Resources - Confusion, China Shift, Dislodging, Crashing CupBoards

We find that the lexical values associated with the 'markets' of the USofA, which in this case include the commodities exchanges as well as the west coast, and other smaller trading venues, are trending toward 'primacy'. The lexicon of emotive values around which this processing is based is organized as a multi-dimensional array of indexed emotional value numbers. These numbers express relationships between words (and or phrases) and emotional contexts. These emotional contexts

include such as impact (i.e. impact on the current emotional state), immediacy (i.e. a sense of), duration (i.e. how long will this emotional response carry forward into the future), response\_result\_inner (i.e. direction of emotional change, inner), response\_result\_outer (i.e. direction of manifest behavior change), and other similar constructs. As a result of the nature of humans, and how we construct and tune our lexicon, some concepts have a further, meta-identifier which is labeled the 'state of primacy'. This notion is sort of a meta-context, and goes to the idea that some emotional states are more 'prime' than others. An example is that of a parent defending their children. A slightly lesser state of primacy, in the nature of humans, might be the parent defending their spouse. So in these two examples, while both are prime values, one is slightly higher numerically than the other. And thus a shading up and down the emotional response scale is created. As one might guess, self or family defense has a much higher emotive response value at all levels than say, emotional response to peer pressure to mow the lawn. And in this example the latter would have virtually no 'primacy' value, even though, peer pressure as a separate emotional motivator, has a relatively high primacy value.

The above, clear-as-mud, description was necessary as we need to pass on that a large scale shift of the 'state of primacy' values is occurring in this run within the entity designated to represent the 'markets'. We have a range for primacy which runs from zero/0 to 128 with the lower number actually expressing the 'higher primacy state'. In past runs, as an example, the recent FannyMae/FreddyMac, and FDA warning, or the pharmaceutical note of last fall, we find a shift downward in numeric primacy value for the particular lexical group just prior to seeing the subject of that group appear in the press with the (more or less) predicted emotional values accompanying the story. Sort of. Not quite that clean, but the point is that as the numbers shade down toward the zero state, we see a rise in emotional values around the subject and these emotive sums, have in the past, reflected a negative. In the case of the usual 'markets' or financial lexical subject primacy values, we would expect to see a range that might go from 23 to 78 in the normal course of events,

with 23 being somewhat of a down trend predictor of 'high' emotions, though likely negative in sum. The current 'markets' primacy value from this run is 3. It has never, in so far as we can remember or determine, been this low a number, which indicates a significant primacy state change is probably imminent.

As for the nature of that change, we see that our emotive values sum to a primary aspect of [confusion/dis-orientation/unknowing] whose attribute sets contain descriptors for a wide variety of both paper 'assets' and actual commodities. Now that the timing seen in ALTA 105 is here referring to the 'dollar being rejected by all' it would appear that a period of 'what next' will ensue.

The emotional tone of this 'what next' period is best summed as [confusion] in a very active sense of lots of confused people running around interfering with each other and compounding the whole situation which is already looking pretty ugly into a really rotten mess.

There are indicators which tie some circumstance which occurred on or around the winter solstice (Dec 20-23) to a future (rejection/discarding/cast off) [request] for (honorable)[relief] which is seen as leading to a (retreat) in [currency] markets, especially those in which [material/items/resources] are at play. The interpretation of this could be that some set of circumstances of last December are to become prominent in a legal or regulatory action. Further that the (deciding/determining/finding) [authority] will (cast out/reject/dismiss) an (honorable/just/deserved) case which in turn causes some political ramifications which in turn are widely seen or credited as the trigger for a currency downturn. Further, the number of references to China should not be ignored in this particular instance as perhaps the point at issue involves trade with China.

Also hanging off the primary [confusion] thread, we find that an economic power will be seen to go into [backwards motion/backwardization/retreat/reversal of fortunes]. Again, there are

many cross links both internal to the Markets entity and to other external entities which resolve down to China. It could well be that a large part of the new state of [confusion] as the operating paradigm may be related to the perceived state of the Chinese economy. We do not have any clear indicators as to which [economic power/currency base/geo-political division] will be seen in [backwards motion], but the result will be to add to the already deepening state of [confusion]. For a brief period the whole [backwards motion] will be (active/vigorous/athletic) [denied/rejected], but this (seizure/grasp/obtaining) of the [real] [picture/vision/state] will precipitate a [singular](event/happenstance/occurrence).

As an attribute of the secondary aspect of the [economic power] going into backwards motion, we also have a completely populated structure which is primarily externally linked to the Populace entity and the Terra entity. Within this structure we find that (difficulty/hardship/obstacles) with the (distribution/settlement/dispersal) of (demanded/expected)[resources] will lead to a [politician] (compounding/multiplying) the [problems/incidents] by (going too far/excessive) which in turn would seem to [expose/leak/reveal] (culpability/responsibility). During this period of [confusion] the emergence of this 'incident' with the too-verbose, too-revealing politician will be significant as it will later apparently be able to be used as a marker for significant shifts in the primacy state. That is, it would appear that at this same time that this scandal is developing, we will see the shift backward of the economic power {which might be China} and we will see the sudden rise in price-inflation for commodities, at the same time that currencies come under real pressure. The state of [confusion] has many secondary aspects, and attribute sets which cluster the idea of currencies about or within the central nature of the confusing time. It would seem that a reasonable interpretation would be that the dollar will come under severe and increasing pressure as the global reserve currency, but that a suitable replacement will not be perceived, and [confusion] will result globally in all the markets as thrashing around continues for a period.

We can also note within the lexical structure an aspect/attribute set which goes to the idea of the (destruction/removal/rejection) of the [institutes/conventions/social structures] of the [past], and that these [past](imposed)(restrictions/limits) which resulted from [social] (conventions/traditions) of a previous age will be a [target] for (reform/reformation), but will not in any way, it would appear, (alter/fix/correct) the (degradation) of the [conditions] within the Market entity. This item goes to the idea that a 'reform' movement will be promoted as a 'cure' for the [confusion], at least in one market area in that this aspect has attributes for energy, and bonds. In this case the 'cure' will be instituted and then, as noted above, things get really bad from there. Not only is the cure to be an abject (failure/incomplete execution), but the days following the 'reformation' will see that the [participants] will (howl) and (demand/impel/compel) the (return/restoration) of [days]. That is, one interpretation would be that the groups involved will demand that 'things be restored to the conditions prior to institution of reforms'.

These demands themselves are seen, through cross links both internal to Market entity and back over to the Populace entity, as exacerbating the whole of the [confusion] state. Within the lexical structure, from the point of the demands for 'rollback' or 'undo' we also note that significant portions of the lexical structure from the prime aspect of [confusion] downward through the attribute set are internally cross linked. This implies that we will see the whole metaphor of [confusion] being multiplied in a rather severe fashion as we progress through this spring. It would appear that this confusion will extend to the point where [traditional/proven] (indicator/tests/sensors) will no longer be viable. And once discarded, the [mental][confusion] will rapidly lead to (loss/lost/discarded/not found/unknown) (sense) of [direction/purpose/guides]. As though, those who are directly affected by and participate in the global trading arenas of the markets will soon find themselves operating within a very disturbingly (un-coupled/unhinged/not-connected) environment.

The image of [confusion] amplified by (uncoupled) will be the primary external impression of the markets for currency, paper 'assets', and actual commodities during this spring, and into the first part of June. When we progress the modelspace we note that [potential](explosive) is repeatedly arising in association with actual commodities. The suggestion is that food group commodities, as well as fundamental industrial commodities including energy, and metals will be in high demand. This is part of the whole [confusion] state as these commodities will apparently jump in price while many other elements of the wider, more complex social markets will decline in a distinctly deflationary form. Within this aspect, hanging under the (uncoupled) primary attribute, and cross linked back to Populace we find that [noble][metals] {presumably silver, gold, rare earths, and platinum group metals} will be (rejoined/bonded/connected) within the Populace' perception as (great)[wealth] and [personal][prosperity]. The (greed) to (hunt) and (hoard) {note active case here} is what is seen as providing the conditions for (explosive) [potential]. We also need be mindful that ALTA 105 had repeated references to the 'dollar being rejected by all' and the 'radiance of gold'.

Further let us again note that we are observing a change in the state of primacy within our modelspace relative to the Markets entity. This meta-level indicator has proven itself remarkably accurate in the past at predicting significant changes in over all social 'mood'. Such a large scale mood change would be required for, and would be the expected outcome of the abandonment, or degradation of the dollar from its perch as global, reserve currency.

Further, we find that somehow the events surrounding the shift in perception of the wealth inherent in [noble] [metals] is also tied to the Asian tsunami of December. This link is less clear, but is apparently of some importance as either a marker/indicator or a causal agent.

We can also note that within the lexical structure is the concept of a [myriad/multitude] of (self-perceived/self-seen/personal

view/opinion)[stars/lights] which will all (compete) for [energy] and (spending). All apparently will be (clamoring/shouting/demanding) their [share/portion]. Also specifically we find that (unhampered) (spending) will (seize up/coagulate/congeal) for everyone {massive cross links to Populace entity} in the course of a [moon/month] just like the (slowing/degradation) of a [top]. The lexical structure would seem to be implying that the various groups will encounter the change in their personal circumstances quite literally over the course of (bedding) and (waking) on a [single/one/unary] [night]. As though the perceptual realization of the state change indicated at the meta-level passes around the globe and affects people 'overnight'.

Leaving aside the numerous cross links between the Market entity and the Terra entity for the moment, and just concentrating on the China related aspect/attribute sets within the Market structure, and isolating those, we note that the Chinese economy, as perhaps indicated above, does show that it also is making a significant state change. The primacy state {as extracted from the Markets entity, and dealt with in isolation} for those China elements shows a change from a reading of 48 to a developing status that, as of this processing, is crossing over into 58. Within our understanding of the primacy states this would indicate a general lessening of emotional intensity. Or, if preferred, a lessening of potential, either socially, or economically. This perhaps does signal that China will be seen as the economic power that goes into backwards movement. In any case, the primary aspects for the China elements show as [awakening] {nice fit there} and [satisfaction]. Further we note that [satisfaction] has a modifier of (placid/contentment) and shows an attribute set suggesting that (considered/debated) [change/alteration/deviation] is the causal agent for this contentment.

Unfortunately, when we perform the same exercise on the 'dollar' as a subject, that is, to extract all the dollar related references and re-sum just those, an entirely different, and non-placid picture emerges.

If the USofA dollar were to be treated as its own entity, its primary aspect would be (dissolving). Further, as we progress the modelspace through the time period of this spring to early summer {actually about mid June} we note that (dissolving) is changing into (stopping) the (compulsive)[behavior]. Also, the primary aspect of the dollar currently as (dissolving) has a completed secondary aspect/attribute set which goes to (broken/crippled/hobbled)[feet] and [legs]. Within the supporting attribute set for (dissolving) we also find that [vessel] is (ruptured) and the [cargo/contents] are (spilt/lost/flotsam). There is also a very curious triple cross link from this attribute set both to Terra, and Populace and in all three cases is referencing a [feminine][nature] or (womanly)[mask]. Merely noted as to its unusual nature. It has not been seen often in the past, and when it has arisen it was associated with a female taking center stage in some scandal or event causing circumstance.

Within this primary supporting attribute set, as well as cross linked to its own secondary aspect, is the idea that the [meaning/value/contents] of the dollar will be (shaken loose/shaken out/dislodged). During this dislodging of the contents, which will begin seriously during the period of over riding [confusion] as the operating metaphor for the markets, we will see that a very public {arises from a cross link to Populace entity} [shame] or incident of (shameful/disreputable) (betrayal) will emerge. The lexical connections are unclear as to whether this 'shame' is attached to the dislodging of the contents of the dollar or merely is a co-incident marker to the period. However, it is apparent that for some period of days, the public shame will occupy the public media of the USofA, and by extension, the globe.

Returning to the primary state of the Markets entity as [confusion] we find that the internal cross links to the dollar arise back to the Markets at the level of an aspect which says clearly (fluttering)[chaos](disperses)[energy]. Further, within this tertiary located aspect, we find a completed attribute set which goes to the (forced)[river](breaks) its (course) and (bends) its [former/past/previous]

[walls] to [rubble/ruin]. Of course one obvious interpretation is that the dollar sliding from its status as reserve currency will have a significant backlash upon those institutions both financial and social which worked so hard to establish and support the dollar in that status. We also note that this tertiary located Market entity aspect does have cross links back to the Populace entity and within those cross links we find (crashing)[cupboards] (provide)[weapons] for [anger]. Curiously, this is close to a reference we saw last year as regards the 'casserola' revolutions in Argentina and other South American countries. It may be suggesting that a 'homemaker' style revolution response to the dislodging of the dollar will arise in which the banging of pots and pans become the primary, non-violent expression of social discontent.

### BushCo - Sinking Deeper into Mud

Lending support to the suggestion that the dollar will slide from its global reserve currency status, and with some move towards that end beginning this spring, and the primacy state change for the Market entity is reflecting a very broad scale 'new reality', we find numbers of cross links back from the Markets entity over to BushCo entity. Within the BushCo entity, two primary aspects arise. The first has direct two way links with the dollar elements of the Market entity and is best characterized as it lays out within the aspect/attribute set, that is, as (sinking)[deeper] into [mud]. This aspect is joined by a co-equal aspect {in so far as summed emotive values} that is (continued)[impurity/corruption] is (immobile/captured) in (light).

The first of the primary aspects, the (sinking) [deeper] into the [mud] has a very large, multi-dimensional attribute set suggesting that the [mud] is both broad and deep. We find that (frightening)[revelations/saying/speech] will (lay) the BushCo administration (over) into the [field] of [mud]. Repeatedly within these attribute sets the internally cross linked attribute for (danger) as an active item is found. It is found in connection with the [mud] and with [thunder] and with [photographs/images]. We also find that the concept

of 'danger' is held within the BushCo entity both as an active aspect and a static aspect. Further, it is found as an attribute to all the aspect data sets within BushCo. A very unusual happenstance in our processing history. In the modelspace the intricate cross links make BushCo look as though made of 3 dimensional Belgian lace.

We also note that the primary aspects of BushCo, in both, co-equal cases, are supported by attribute sets going to [weakness] and (overwhelmed) by [fear]. These are cross linked back to the Terra entity, and through that entity, back to the dollar components of the Market entity. The suggestion is that the fear, while arising from the degradation of the dollar, is triggered by some circumstance that is weather or climate related.

Another significant lexical item of note is that this run shows the BushCo entity replete with aspects for very primary, and disturbing emotions. We find, as noted above, many references to [fear] direct, but also note that the emotive sums both down the aspect chains, and within each aspect/attribute data set, come back to the concepts of (dismay), and [frightened], and (shocked), and (frustrated), among others. We also note that there are particular references to human body functions which in the past have been taken as a good indicator for 'intensity' at a meta data level. These references are all 'fear response' based such as (blurred)[vision] from [fear][tears], and (slower)[sounds] (overwhelmed) by [heartbeats], and again, [heart](beats)(faster) to the point of (exhaustion) and [palpitations]. These sorts of references are found in all the attribute sets through their internal cross links. We also find that these references are further reinforced with the next layer of lexical constructs such as (inability) to [stand], and (dropped) the [spoon] from the (shock), as well as (disbelief) (leads to/produces/creates) (undigested) [events/items].

Returning to the ALTA 105 report's insights into the BushCo entity, we noted then that a 'press rebellion' would occur over the course of this year which was seen as the cause no end of problems for BushCo.

Within this data set, a similar set of aspects has also been seen which goes to that same idea. The aspect which contains the attribute set of descriptors for the media, and press as may be defined as 'mainstream' or corporate {and thus really a sub set of BushCo through the corporate links} occurs within this BushCo entity as [reform]. And under this primary aspect for the mainstream media, we also find secondary aspects for [reform] restated as (progress) in (rebellion), as well as (destruction) of the [shackles] of the [past]. Further, the idea of a press reform movement is cross linked over to the Populace entity on aspects of [danger], and [shackled/bound], and [greed]. Further we find that as the BushCo entity is progress through our modelspace the [reform] movement of the press is seen to go through the stages of [danger], followed by [enthusiasm] for the (feasting), followed by (resistance) and then leading to (rewards). This progression goes through spring and into about mid June.

Each of the above reference stages is completed by fully populated attribute sets, most of which are cross linked back to the Populace entity. Hopefully this is indicative of a media reform movement which is played out in public sight. There is a curious note that a lexical structure whose primary aspect is [hidden], within BushCo, is linked back to the (dissolving) aspect of the dollar. Perhaps indicative of the dissolution of the dollar as the reserve currency bringing out other hidden aspects of BushCo which were directly associated with the dollar's status.

03.20.2005 Oil - Repression and Armies, Tipping Points - USofA and Terra entities, Markets - Blood Flows Cease, Fresh Momentum Dollar Decline, AIG & Silver, Flopping the data

Note: Entities are identified by a blue typeface. Aspect words are enclosed in square brackets []. Attribute words/phrases are within parentheses (). Interpretive editorial comments are preceded by an asterisk \*.

Data set distilled from 26.77 million reads.

A note on interpretation

If the descriptions of the various entities seem a bit disjointed this is due to the extraordinary number of cross links between entities around common themes within this run. I find that the process involves examining say an element of the Terra entity which has within it links over to an interesting area of the Markets entity. Now this area of the Markets entity is interesting as it seems to indicate expected change. And in turn, within the Markets entity are links back to another area of the Terra entity which also looks active, and a link back to the BushCo entity, again, active. So after following all those links, I come back to the Terra entity to proceed forward from the point at which all the interesting cross links were encountered. Then, immediately, another and different set of interesting cross links start the process all over again such that no entity is examined as a whole, and is rather taken section by section in a 'round robin' fashion as the layers of cross links are followed.

Oil - Repression and Armies

From the earliest of the processing for Part 2, the modelspace has revealed some significant changes pending. First we see that Oil is rising out of the Terra and Markets entities to entity status on its own. When extracted in modelspace, it forms a completely populated entity with a

primary aspect of [repression] and a rising-to-dominance secondary aspect of [armies].

We note that when all the oil specific reads are placed into their own entity, that the emotive sums are rising to about 3/4s of the values seen for the recent tsunami. Further we note that a primacy state change is occurring immediately within the Oil entity. Its summation values are dropping from 124 down to 27. This state change is accompanied by the shift from the primary aspect of [repression] over to the dominance of [armies] relative to Oil as an entity.

Within the [repression] aspect we find attribute sets which go to the idea that a [repression] of [vital] [data] will be (broken/break out/released) which will (shock) the [ignorant] into [stupefaction]. The (release) of the data could be interpreted as being [holdings/cache/storage] numbers. It would appear that the entity is suggesting that very soon the real state of the oil reserves of the planet will become known, the [dearth/lack of/depletion] will 'shock' the unaware citizenry, and presumably will act as the trigger which sets [armies] in motion.

Once the transition from [repression] to [armies] has begun, we find that two secondary aspects with complete attribute sets rise to the surface to [set/decorate/adorn] the [face] of the entity. These are [grief] and [thrift]. In both cases they are strong secondary aspects and their attribute sets are widely cross linked. In point of fact the cross links converge to the various tipping points noted below.

The aspect of the [armies] being [set] in (motion) also carries with it the general feeling of a more or less non-violent, strategic re-alignment. Much more as though armies are shifted to face each other, than launched into battle. There are at least two primary attribute sets which go to the idea of (calm) and (settled/content/peaceful). However, the primacy state change does seem to indicate that at least for the USofA and its Populace, we have a 'tension' resulting from the [grief] side of the lexical equation.

Within the attribute set for [grief] over the realization resulting from the (sudden/abrupt/accidental) (release) of the aspect of [repression] on the Oil entity, we need to note that almost the entire attribute set is cross linked back to either Populace or Terra or Markets. In all three entities, the cross links go to aspects which suggest sudden and profound change.

We find two exceptional elements to these secondary aspects. First, the [grief] aspect is dominated by references to 'female' both at an actual data read level, as well as at the meta data level. The suggestion certainly must be that a female will take center stage in the expression of the [grief] aspect of the primacy change in Oil. This female will also not have an easy time of it. She is described by the attribute set as (modest), works in a (public building/public space), and is apparently compelled either to, or by (sacrifice). One interpretation could be that a female whistle-blower will be the point of the 'release of the repression of vital data' and will, through that act, sacrifice herself.

The second exceptional element is an attribute set which seems to tell a story. It would suggest that [danger] is (sneaky/snuck up upon/coming from behind) and that an [official] of the [government] will (desperately) (seek) [audience] with the [prefect/governor/superior], only to be (rebuffed/rejected/held out/cast out). This will cause a bit of a problem it would seem. The result will be a total fiasco. Not only will the [danger] be actualized, but it will arise apparently [unseen] and the resulting (misfortune) will be like the USofA was (hit) from (behind). We have NO indications of any actual attacks or terrorist activities and this should not be understood that way. In our analysis of the emotive shifts, the data is suggesting that some one is attempting to warn of the problems with Oil, and the dangers that arise for the country from the energy issue, NOT from a terrorist attack.

We can also note that the references to the [official] and his/her problems getting an audience are heavily cross linked back to the Populace entity with primary attribute sets indicating the USofA

populace. Within this narrow cross linked attribute set, the suggestion is that the populace of the USofA is about to take a 'hit to the head' at least in so far as their concept of the future and energy-consumption. The emotive sums are for a level of primacy state change that is equivalent to what was seen developing last year. In the course of the work over 2004, we noted that a level of primary 'perception' state change was occurring. It was weather related we knew about spring of 2004, but it was not until December and the tsunami that we actually realized the primacy state change within the global population. So for most of the year we were reading the emergence of the change, and it was geo-event triggered, and we are still absorbing the change in state {relationship of humans to planet/solar system/universe} both personally and in the social aggregate. Now the data suggests that another such state change relating to oil/energy will/is occurring.

While the above may be seen as patently obvious given recent actions in the oil/energy markets, what our data is indicating is that the beginning of the primacy state change for oil has not yet arrived. In fact all our references tie this state change to the tipping points seen below. Suffice it to say that our indications are that this state change will begin in all seriousness on or about April 4 of 2005. What has come before that will be seen as 'preparatory' indicators.

### Tipping Points - USofA and Terra entities

When the modelspace is progressed with the new data from Part 2 processing in place, we can see the Terra entity, and that part of the Populace entity with USofA geographic references dominant, each progressing into a 'tipping point' mode.

The 'tipping point' mode originally was seen in our work in June/July of 2001, and at that point we saw all the entities within the modelspace coalescing into a very large, black sphere which led to a tube shape

which in turn went back to a sphere that then 'blew out' into the more or less regular state of chaos of the entities within the model. We now interpret the shift through that tipping point as an early indicator of the 911 attacks and the subsequent emotional storm within the Populace. There have been several other, albeit smaller, tipping points arise which also were able to be validated to actual, significant emotional changes. The result is that we feel confident in our interpretation of 'tipping point' conditions as being event driven, large scale, emotional context changes.

There are several tipping point conditions arising now. Unlike in 2001 when we had all the entities coalesce into a single 'dumbbell' shape, we now have the individual entities separately forming small tipping point 'dumbbell' shapes within the modelspace. These are most immediately noticeable in the Terra entity and the sub-set of the Populace entity which defines the USofA.

Curiously, both of these separate entities form tipping point conditions which, when progressed, arrive at the same place. That is, both entities undergo a transformation and end up with a very large shared aspect/attribute set.

In the case of the Populace, USofA subset, we find that the tipping point will apparently center around a [scandal] which is [sex/sexual] based. This [scandal] will involve a (stranger) who is [inappropriate]. Further, the [sexual desire] is seen as (harming) the Populace entity, and the (harm/hurt/wounding) will arise from the (faithful servants). It may be that this is another reference to the ALTA 105 'press rebellion'. In any event the 'stranger' is seen as being (censured) for being (inside). Then the (physical assets) are placed at (risk) of (exposure) through bad [commands]. The [stranger] will be (rejected) by the (faithful servants), but nonetheless will (spark/start/initiate) [fires]. The entity actually has a section of the attribute set which goes to the idea of the [structure/building/house/shelter] is (burning/burnt) and the [servants] (flee) taking with them (precious)[assets/commodities/resources]. There is (blame/recrimination/complaints) following the (servants) many of

whom are apparently going to (proclaim) [from afar/at a distance/removed from] their (loyalty/faith) but all will be seen as [traitors/rebels] by the Populace.

The first aspects which emerge following the resolution of this tipping point are [foaming] and [betrayed][innocence]. These are seen as dominating the (discourse) of [neighbors] for some time, perhaps a few weeks as the [betrayal] of the Populace by the [sexual desires] of the [host] are digested by the Populace. The Populace entity emerges very changed from this tipping point. Due to our processing regimen we can only extend the modelspace so far forward with each type and part of the data being interpreted. At the moment we find that the Populace entity will still be involved within the expansion from the tipping point through April and into May.

The other tipping point condition arises within the Terra entity and is linked to the data sets which suggested the [shift] of the [plate] in Part 1. This data still goes to that idea of large scale changes of planet earth which produce certain emotional states or responses within the global populace. Again tied to early April by most of the date range data, we find that the Terra entity is going to go into a tipping point which is seen as being initiated by [lightning] and [crust] (release) of [tension]. The further restatement in a whole different aspect/attribute set of the same concept of a movement of the sections of the crust of the earth is, in this case, an explicit validation of the previous interpretation. Again, within the processing of the data for Part 2, we had a completely new data set emerge which explicitly has within the attributes, the expression of [crust] of the [earth] is (split/torn) and [lightning] in (four/4) (strikes) [announces] by [eye/sight] a/the [thunder] which sets the [earth] (rocking) like [plates] on (fluid). This concept is further reinforced by secondary aspects and their attribute sets which go to the point of the [pulsating] (motion) of [boats] on (water) will/does [flow] through the [planet/earth/ground] (four/4) times. This is further amplified by the tertiary aspect and its attribute set which states that the [planet] will (ring) (four/4) times; (two/2) [large] and (following/followed by) (two/2)

[small]. Obviously the interpretation would be for 4 earthquakes to 'roll around the planet' subsequent to, or as part of the crust movement.

The Terra entity curiously, as noted above, emerges to the same lexical set as the Populace entity. That is, to [foaming] and [betrayed] [innocence]. In the case of the Terra entity, the data set is a super set of the Populace entities attribute set, as though folding in yet another reason for 'innocence to feel betrayed'.

We can note that the Terra entity contains attributes going to persons being (held fast/restrained/blocked) by the actions of the earth, and that both [danger] and [damage] will predominate for some time after the geo-event which acts as the trigger to this emotional tipping point. In the case of the Populace entity tipping point where the effects are still being worked out in late April, and May, we surmise this due to the shape of the emerging entity as it comes out of the tube shape which represents the actual tipping point. In the Terra entities case, its tube-like tipping point activity is still ongoing in to May in so far as we can determine with Part 2 data. We will await changes to emerge to the entity as we process the rest of the data in this run.

While examining the Terra entities repeated occurrences of the concept of people being 'blocked' or 'held fast' we must note that as the subset is also contained within the USofA sub entity, the same concept of 'blockage' arises there. Further the suggestion is from the order of arrival of the elements within the modelspace that the USofA tipping point will have political ramifications which in turn will exacerbate the already rising problems from the Terra entity. We find that the USofA sub entity, when progressed through the modelspace takes on the primary aspect of [opposition] with an attribute set that goes to the idea of a 'house divided against itself cannot stand' and the idea that 'great things cannot be accomplished in the absence of consensus'. Further the attribute set offers that [dueling][family] (cannot succeed) (during) [war]. The data is suggesting that the two tipping points, one within Terra and relating to natural occurrences and the other within the USofA

and relating to political and divisions amongst the Populace, are intertwined. It would also seem, at least in so far as the emotional sums and their numeric representations, that the Terra entity tipping point continues to raise the emotional tone as we move forward through the tipping point within the USofA sub entity. A further augmentation of the idea of [opposition] comes from the line of secondary aspects which all go toward [obstacles/difficulties/obstructions].

In the case of the Terra entity tipping point, the data clearly is indicating a [sun] related trigger. Further it suggests that the [drought] will (induce) [earth/ground] (movements) during or shortly after the [sun] triggers the tipping point. While the actual damage will arise from earth movement, there is a [storm] component as well. Not only do we have numerous references to [lightning], but also the attribute set contains references to the [southern hemisphere] where it is now going into [autumn]. Within those references are two diverging but connected subsets. In one we find that [autumn] will be more or less skipped and [winter] will slam the southern regions. This in turn causes a [withdrawal/lifting/raising/retreating] of the upper atmosphere, and very large quantities of (water) are taken up to become [rain clouds].

Apparently the [electrical/force/energy] activity associated with or caused by the [plate] [shift] will draw up these southern rivers of water in the atmosphere, and they will dump onto the northern hemisphere such that [fields] (still) (cold) with (ice/frost) will be [converted/transformed] in to [vast/huge/large] [swamps/marshes/flood plains]. There are augmenting sub attribute sets which contain references to 'food not planted', and 'nourishment decline', as well as explicit references to impacts on transportation which result in a north american continent [standstill] for movement of trans continental goods. This separate thread is positionally linked to the period of the storms in the southern hemisphere, but may slightly precede it.

The images of the water being born up from the southern hemisphere are of 'rivers' of 'thousands of miles' in length. Curiously we also find a

cross link to the BushCo entity, again, tied to early April, in which [water] dominates. It would seem the attribute set within the BushCo entity is corroborating the idea of [water] leading to a [standstill]. Within the linked BushCo set we find that [water] (forces) (many) into a [dangerous](ravine), and that (all)[progress] is (stopped/stymied/impeded) by either a (steep)[embankment] or a (deep)[abyss]. Further within the data set in BushCo and cross linked back to both Terra and the Populace/USofA subset, we find that [rainwater] will be seen by [officials] as a (curse) and something to be [wailed] about. The attributes also contain the idea that [essential] for [life], (too much/excessive) turns [sweetened][land/ground] into (stinking)[marsh] [home] of [disease]. This occurrence of cross linked attribute sets occurs during the progression of the modelspace forward. In other words, the BushCo entity acquires these attribute sets as we move forward and go through the 'trigger geo-event'.

A further oddity within the processing is that the BushCo entity's primary aspect changes and becomes linked to the primary aspect of the [weather] subset of the Terra entity. After the Terra entity tipping point begins to resolve in late April and through May, we find that the primary BushCo aspect is cross linked at the primary-2-primary level with the [weather] subset, suggesting perhaps that [weather] comes to dominate politics.

In support of this, we can note that cross linking is very heavy from the point of the tipping points and onward. Within the USofA subset of the Populace entity, and further within that set containing references to the Pacific North West (PNW) we find numerous aspects/attribute sets going to the idea that 'natural earth movements are accelerated' and come to 'dominate all conversations'. Further, that 'daily activities' will include 'placing mats on the floor' and 'moving everything breakable to the floor'. Again the idea of lots of shaking comes through as it did with the processing for Part 1. Again we note the rise over time of indication for repeated earthquakes in the PNW concurrent with, or slightly preceding 'marsh conditions' arising in the midwest.

The attribute set within the Terra going to the 4 shocks ringing the planet, is cross linked back over to the PNW subset of the USofA subset. Within that subset of attributes are repeated restatements of the idea of [dangerous conditions/danger] as well as [danger] coming from (collapsing) [roofs] and (breaking) [wood] [beams]. Internally cross connected within the Populace entity we find that the earthquake problems in the PNW are at least time-related to flooding elsewhere. There are indications for flooding in the PNW area as well, with some subsets going to the idea that earthquakes will release lahars or 'streams of mud' sufficient to 'cover your head'.

While there are various date ranges which arise within the processing, none of which we take too seriously as our timing clues are usually off, we do note that repeatedly the date May 21st arises as a general date range 'peak' indicative of the sifting of the entities at that point.

Also curious about the May 21 date are cross links back to both the BushCo entity, and the Markets entity which in both cases link to aspects of [wind]. Again, within both attribute sets in both entities we find repeated references to the [strength] of [wind], and [wind] (moving) [mountains], and [wind] (stopped short/halted abruptly) by [mountains]. In both cases there are only a few shared attributes, with both aspects of [wind] developing their own 'flavors' within each entity. For instance within the Markets entity, as relates to primary aspect [weather] sub-aspect [wind], we see that May 21 is held within an attribute set that goes to [evil] [wind], and (damage) is (causing/equal to) (fluttering) [chaos] which is seen as causing [financial](reduction/removal). Also, we note that the BushCo descriptors for [black] (with/from) [rage] and (raging)[frustration] are within an attribute set which links back over to the [wind] and to the Terra entity for the [wind] (storms) [ten/10]. This attribute set within BushCo hangs under [wind/atmosphere] and is oddly emotional in nature with several bespoke emotions rising through the processing. It is as though the winds will [impede], or [tarry] or [restrain] the (desires/desired response) from BushCo such that the

bespoke emotions of (rage), (frustration), (impotency/weakness) will emerge. There are few clues to the types or places for the damage within this entity, more a case of the words which go to the response to the [wind] [storms].

In the Terra entity, cross linked back from BushCo and Markets, and under [weather][wind] we do find some clues as to damage. There will be crop damage to (emerging)(vegetation), and many [cattle/livestock] will be (without) [house/shelter]. Additionally, we find that [ribbons] will (peel) (from) the [earth/ground] like (skin) from a (lizard). Perhaps this indicates, as is suggested by the references to (speckled) and [black] that we are going to see winds so strong that they lift asphalt from the ground like [ribbons].

Also linked to the [wind][storms] internally within the Terra entity we find that it is likely the [winds] over the oceans which bring the [rivers] in the atmosphere to the North American continent. These cross links go to the sub aspect of [oceans] and is led by two co-equal secondary aspects of [dangerous], and [restless]. We see that (deep) [ravines] will lead to a (flowering) and that this somehow participates with the [rivers] of water in the atmosphere noted earlier. The oceans as a sub aspect are indicated to be in (transition) or (transformation) and that a further internal link within the Terra entity indicates that a [mountain] (east) of [China] will (rise). This is further amplifying the theme of land rising seen in ALTA 105. Apparently this rising will also cause the [abyss] itself to [rise] and may well be referencing in another area the idea of a sloshing of the oceans near the PNW. In this case the [abyss] is seen to (rise) and that in turn causes the [oceans] to begin (pushing)(upward). There are also several instances of references to (forward) and (backward) with all these references to back-forth motion being held between two instances of 'danger', one as a controlling aspect, and the other as a terminating attribute. The suggestion is that the rocking of the oceans is going to create conditions of danger at each extreme of the motion.

The attribute sets within Terra that are referencing damage from the [oceans] and their back-forth motion, show that [mountains] will be (scarred) with new [ravines] {likely meaning undersea's mountains}. And that (energy) (disintegrates) into the [earth/ground], and that [salt] (remains) behind after (evaporation). That the new (salt line) will [mark/stain/brand] (mountains), (rivers), (valleys), (hills), and (far) [coastal](plains). This new (salt line) is seen as marking the [barriers] to the [sea]. Curiously, along this whole aspect and attribute set holding (salt line) we find links back to the Populace entity which go to the idea of (tying/making fast/securing) to (trees) at (bud) height for a (night)(rest/sleep/encampment). This also has several links internal to the Populace which would indicate that (scavenging/salvaging) [groups/affiliations/tribes/villages] will also live along the (salt line). Not only is scavenging referenced directly within the reads, but appears also within the emotive summation value related lexicon, and is further supported by attributes going toward (house/shelter) of (floating)(debris/junk/waste).

As one potential source for 'oceans rocking' we note that Part 2 data processing has augmented our Antarctica focused data both in Terra and the Populace with a new subset which is rising in emotive value and suggests that the B15 iceberg has [shed] its [iron hook/grip] and will cause a bit of damage as the [wind] (drive) it (escaping) like a (frightened) (pig) toward the ice tongue. The [dependents] on (clemency) are seen as requiring (rescue) since the [ice berg] (crushes) the [success] of the [land] at (holding) (firm). This causes the [land] (guests) {presumably either the humans or the glaciers} to vacate. If one were to presume that the B15 berg rubs off a bit of restraining ice, thus releasing glaciers off of Antarctic land and into the oceans, this could account for the rocking of the oceans and the damage.

Returning back to the Terra entity, we note that due to the [ocean] activity, that the [rainwater] floods discussed earlier are seen as (bound), and (cannot) (flow) (away). This is cross linked from the [oceans] sub aspect back to the [standstill] links and is seen here as a reinforcing

structure for the idea that water will cause transportation problems on a continent wide scale.

Within the tipping point progression of the Terra entity, we can specifically extract that data set which represents the Sudden Catastrophic Global Climate Change as a near entity. When we do so we note that this area is also undergoing a primacy state change. Its former numeric range was centered around 109 in the general consciousness and now we find that it is dropping below 9.

The subset here representing SCGCC is most active late spring and moving on through summer. The primacy state change occurs at the beginning of this period and strengthens over time. We find that the associated primary aspect for SCGCC prior to summer is [quiescence] which then moves out to be replaced by [tension] with the coming of summer. We find that this sub set is aspect headed with multiple, and complete references to 'nature' and 'planet earth' with very high negative emotive values all centering on 'fear' as a summation emotion. We find references to [refugees] and within the supporting attribute set, note that these 'climate refugees' will have a very rough time of it indeed as they are 'blown around like old rags'. Again, we note a [wind] dominant theme, but also that (high)(rocks) will be the first point of 'refuge', but that they will have to be given up soon after as they [provide] (no/none) [food].

We further note that SCGCC as a sub set is replete with 'danger' attributes. Further there are attribute sets which go to the idea of 'weather forcing families apart', and that 'return' over the rivers will be impossible. This apparently both due to earth movement as well as torrential rains. Further amplifying this idea are the images suggested by attribute sets which contain [safety/safe] [clinging/grasping/gripping] to [trees](tall) and (sturdy), as well as [many] (become/will be) [trapped] by [rainwater] (forcing) [tree] (rescue).

In so far as SCGCC is concerned, summer is the time of [action]. We note that the [winds] are seen as [capricious], [dangerous], and [perpetual]. And that [rainwater] will [fill] a (long) [dead] [sea], and thus [restrict] [movement]. It will be this shift into 'action mode' which will be responsible for [tension] rising as the primary aspect for Terra as viewed from the Populace. In fact, from the emotive sums being found, we should even see some references to the rising state of tension between humans and planet earth in the news as we approach summer.

Directly related to the SCGCC descriptive lexicon we find that a whole series of cross links within the Populace and the Terra entity go to reinforcing the idea that spring/summer brings a period of [restricted movement] which will be [harmful] to the economy as well as the continent, and the populace. This period is seen to (greatly) affect [food] deliveries and production. Specifically [rushing waters/torrents/waterfalls/cutting waters] are seen as [energetically/forcefully] (blocking/hindering/barrier to) [transportation]. Within our [transportation] aspect we also find that [food] sub aspect is augmented with high emotive value words all going to [deadlock/standstill/blockage/cork].

Apparently we will see the [rushing torrents] (block) [food] at [summits], and [drag] [carriers] through [mud](heavy) [waters], (spilling) [grains] into the [rivers]. We get some indication that the effect will be prolonged as [hunger] is seen as (driving/compelling) [many] to take (great/huge/large)[risk].

An unexpected benefit of the nasty weather headed to the USofA is that apparently it will start a bonding process with similarly affected peoples around the planet. This is seen as arising at a skin-2-skin level without either the approval or support of government. It apparently is significant enough that the supporting attribute set contains about 8 per cent of the lexicon, post-primacy state shift change. So it is as though shared suffering bonds in spite of stupid politicians.

As to the extent of the disruptions, our lexicon suggests that the overarching view of the weather or climate this spring and summer will be reflecting [confusion] back from the Populace as we will 'rock' back and forth with out of season weather patterns and 'freak' weather conditions. The suggestion from the data is that the weather will severely impact food production and will even 'shift demographics' over large areas of the country. The impact is seen as being more costly than 'war'. A vague reference yes, but meaningful in that currently war is costing some significant per cent of the USofA GDP and now we apparently can expect that this year will see 'weather' or 'climate change' cost more than that. And that comes at a time when our projections suggest the dollar is about to take a large stride downward toward toilet paper status. A very rough year shaping up.

## Markets - Blood Flows Cease, Fresh Momentum Dollar Decline, AIG & Silver

Within the Markets entity, and within an aspect set bounded by April through May 28th, we find a reference to [blood] as a secondary aspect with an attribute set which states that [blood](flow) (ceases) in turn, the [mind] (stops) (spinning), and [pale] (thoughts) (come) (before/prior to/preceding) the [last][phase]. Further we find that (no longer/cessation) of (seductive) [appeal] will cause [loss] and [blood] will (drain) (out) leaving an [empty][basket]. Further that (assets) will be (sacrificed) with (large) [public] [presence], but that the (sacrifice) will be [meaningless] with [erosion] following.

The entity further has [blood] references within the [currency] sub aspect, and within the [trading] sub aspect We note that (financial)[abstractions](bleed) until [strength] and [movement] are gone. That these are responsible for the (loss) of (material)(fertility) and lead directly to the state change shift to a primary aspect of (imperceptible)[respiration].

We can also note that while currently the Markets entity emotive state primacy value is in the mid 20's, it usually floats in the mid 50's range. The supposition is that recent discussions about the social security 'reform' by the administration has raised the emotive profile of the markets for this run. However, we also need to note that the Markets entity is also signaling a state change of some serious proportions in that it shows a movement out to 124 within the state scale. While 124 is where it finishes when the progression of the modelspace is taken out to July(ish), we also note that led by the [energy] sub aspect, the Markets entity will spend some time in April at an emotive state primacy value of 1. That is, One, or 1. This basically is saying that [energy] issues will drive the Markets to a point where this entity totally dominates public discussion however briefly. While not a real stretch of an interpretation, our data is indicating that early April marks the beginning of the shift of things with a building trend of negative change until the tipping point regions of May 21 are reached. From there the rate of change, as gathered from the progression of new words into the lexicon, is seen as very rapid, and the general tone is downward, ever downward.

Cross linked from Markets to Populace we note that emotions reacting to local environment will be driving factor this year. Along with the removal of the economic indicator or marker as noted previously, we find numerous cross links at levels showing that [shocks/quakes/earthquake/shakes/temblors] will impact the markets entity, as well as impacts from the [wind] storms, but oddly, triply cross linked back to both the Populace entity and the BushCo entity but with the Populace entity containing the superset of attributes we note that [shocks](emotional) to the BushCo [administration/officials/advisors] will (jolt) the administration, and that (failures) to (see/grasp/perceive/internalize) [reality] will lead to (proposals) of (unexpected)[delusion] which when [printed/proposed/promulgated/said] will themselves (compound) the [misery] of the [markets]. Under this thread of [misery] as a developing minor aspect we note that [dissolution/separation] of the [elements] is

arising as the driving aspect/attributes. Further that (disunity) will [emerge] from a (congregation/gathering/meeting) and lead (directly/quickly/expeditiously) to [confrontation] between (cousins).

Some aspect of the shocks that (jolt) the administration will emerge from Iraq as early as late March. These will escalate the emotive values around Bush's war in Iraq both within the administration and within the Populace. Further these events that emerge will take hold of the Iraq war direction and are appearing, in the progression of the entity through our modelspace, to dominate through at least to the end of November if not the year. The general impression is that events on the ground within Iraq beginning in late March but with a noticeable 'up-tick' in early April will take control of the situation away from BushCo, even within the minds of BushCo. We also note a terminated, short attribute set of minor activity suggesting that from March through early May, efforts will be made to [cover] up the situation emerging, and will be so un-successful as to be stopped sometime in mid May. Please note that the emotive sums involved in this 3-way cross linkage are extremely high. In fact, as high in impact values as what was seen with the WTC attacks. Perhaps, in all total sums, higher than we have yet encountered. In any event the carry value of the emotions will take this out to 2006 very likely. And the negative emotive sums continue to escalate as the three entities are moved through the modelspace. This indicates that as the perception, if not the reality, of BushCo losing control of the situation in Iraq progresses, that response actions actually make things worse. We can note that several of the 'failure' aspects sets actually more than double their attribute sets as we move forward from March through November, but they continue further {modelspace currently goes out to February of 2006 but only faintly that far}.

A further muddying of the waters {pun intended} are the number of cross links between the entities showing that Terra events will dominate other concerns. We can even note within the Markets entity that both [storms] and [seismic] show up and both are grouped with a date range of [March 21 through March 29]. In fact, the attribute sets for the

[storms] include a reference to (hyperactivity/excessive activity/excessive motion) linked to the last half of March. Somehow this hyperactive storm will impact the emotional surety value {that value denoting the strength of feelings about a subject} in such a way as to participate in the (jolt) attributes of the BushCo entity.

And if that is not enough we also find a completely populated aspect/attribute set under [dollar] with a sub aspect of [Federal Reserve] in which it seems to indicate that (new/fresh)(momentum/impetus/force) will (pressure) the dollar (down). And that this trend will begin on or around March 26th. This thread is not linked as being caused by the weather or other geo-event, but it is cross linked in several attribute sets in which geo-event impacts are carried including financial response. We note that the fresh momentum to the dollar decline begins on the 26th and escalates into early April, again, another reference to April 4 through the 9th.

Note also that this point in the date references within the Market entity is cross linked to the [storms] seen in the Terra entity as well as the response to the [wind] aspect within the BushCo entity. It is the strongest date range indicator that we find and suggests that the period from March 21 {equinox} on through the early part of April will be very troubled. The cross links here within Markets go directly back to Terra or Populace at aspects for [earthquakes], [flooding], [avalanches], [mudslides], [heavy precipitation], [damaging winds], [damaging lightning], and other such not so good weather related ideas.

Further we need to note that the cross links for this period from Markets entity also shows a negative emotive sum with geographic references to Pacific Canadian Coast, Pacific North West (USofA), California, Mexican West Coast. Some small minor geographic references include the tip of South America, and the region of the Jordan river, as well as eastern Australia {already suffering storm damage}.

A curious linkage has arisen within the entity holding the references for all things financial. We note that a [surfacing/rising] aspect deeply (embedded) within [silver][markets/trading/sales/leasing] has a link to the firm AIG. This link is also cross tied back to the [scandal] aspect, sub aspect of [dismay] and [frightened] within the BushCo entity. We can note a fully populated attribute set which suggests that scandal {likely about accounting} at AIG will (expose/reveal) a [silver][thread/line/stripe] that is [constrained/restrained/bound]. This (exposing) is seen as linked, if only through close proximate in time, to the shift of [silver]'s primary aspect from [caution] to [increase]. The rising secondary aspect for [silver] of [increase] sits now, within the modelspace, at a cusp area which is cross linked back to the [repression] aspect of oil. An obvious interpretation would be that the shifting in the nature of the markets toward commodities, especially as led by oil, will rip loose control over the precious metals, at least silver, from the commercial speculators, including AIG.

It should be known that enough persons view AIG as being a participant in the gold price suppression scheme that, within our reads, we find AIG is linked to criminal activities such as market manipulation at least as a topic of discussion. As the balance of conversations about AIG have had a decided increase in such references over the last few years of our data gathering, it would seem that such connections may be at the heart of the coming [opening] of the firm which is seen within our aspect/attribute set as including a [day] (long) (walking/hiking)[tour] of [misdeeds] and [bad][writings] {presumably cooked books}. This tour is seen as being conducted for the [eyes] of the [senate] which may be suggesting some level of officialdom which reports back to the senate, or, unlikely, a senate hearing about the firm. This latter is not too likely as we are seeing the timing clues focusing on early to mid April for this [tour]. Another interpretation may be that it takes until this time for teevee to get behind the story and we start getting a 'tour of the scene' series of teevee shows.

Now, independent of the AIG connection, we note that [silver] as a commodity is about to shift emotional connections within the Populace entity. We are seeing a number of connections as well as a rise in emotional sums around the subject both within the Populace entity and the Markets entity. Curiously in many cases these are not cross linked, which implies that there will be two separate emotive contexts within which silver will be viewed over the next coming few months. It would appear that the Populace entity is signaling that the commercial traders of silver and paper representations of silver will be caught off guard by a, to them, sudden [increase] in demand from the populace at large. On the theory that twice nothing is still more or less nothing we can note that the numeric indicators for the emotional sums relating to the primacy state for silver within the Populace entity have dropped exactly in half. Since our scale has the lower digit as the higher the value, we can say that the emotional response within the Populace entity is suggesting a fairly rapid doubling of at least perceived value.

### Flopping the data

For those who may be familiar with multidimensional arrays or databases within a programming context, and out of curiosity for what may be learned, we have 'flopped our data' which relates to the May 20th date range. This brings the data range itself into prominence and allows all the other associated words to hang off of it. In essence, we make it into an entity such as we can. So in our multidimensional array of emotive sums which link back to lexicon subsets arranged as archetypes, we can re-order our data such that what was a 'column' now becomes a 'row'.

In doing this exercise for May 20th date range we discover that the most fully populated attribute sets shift from 'intensity building words' and emotive sums which we see gathering prior to the May 20th period, over to 'actualizing words'. So, to put it another way, the descriptive words which are associated with the date ranges prior to May 20th are dominated by adjectives which are 'building intensity' in an emotional

context. Then, on or about May 20th, we find that the adjectives shift rapidly to being dominated by 'actualizing' or manifesting words. This is easily determined as we building intensity words can be thought of as those words which place a future tense on the emotional context/content. This could be through the nature of the word or phrase such as 'I want' in which we find that the 'tense' in the emotional sense is a desire yet to be satisfied, thus, has a 'future cast' to the emotive tone. Then in the case of manifested or actualizing words, the tense comes forward to the 'now' in the present and then rapidly becomes referenced as a past event.

With the above in mind what we see within our flopped data is a rising intensity which actualizes on or about May 20th and there after the rest of the year at least out to February of 2006 is flavored by the event.

We suspect that indeed what is being foreshadowed is an event, rather than say a process, in that our word state shift from intensity to manifest, that is, through the tenses from future to now to past, happens all within a very short period, there after only past references dominate.

Other than this hint that an event of some kind will influence the year beginning on May 20th or so, we can say that the words added through association by emotive context summing go to an aspect of [force]. Further that the aspect is magnified by an attribute set including (vibration), (ringing), (resounding), (boundless), (force)(manifest) in the (earth/ground), (force) to (exhaustion), and others of the same vein.

We further see that a [sun] related aspect set is the second most fully populated, and is internally linked back to the [energy] sub aspect of [force]. We also have secondary aspects of [increases] in [power].

While there are a number of cross links back to the Terra entity, there are only a few that actually go to a 'what' kind of aspect. In this case we do find that the [increases] in [power] are cross linked back through the number references and the [power] aspect to the 4 earthquakes within the Terra entity. This is not to say that May 20th will see four

earthquakes. Such links arise just due to the nature of the lexical connections.

As another instance of a nearly fully populated aspect/attribute set, we have one hanging off of May 20th which says in essence, if interpreted literally, that this date would mark the 'last of the chemtrails'. It indicates this through 'cloudless skies are scrubbed loose of clings'. And the 'last' of the 'smears' and 'sky oil' will 'dissolve' that day. So some things have to be understood to be random, or beyond meaning within the context.

However, within the May 20th date range data we do find links to Terra and [out of control/released] [temper] as well as [barrier] (rammed) (through). Unfortunately, both within the Terra attribute set and the May 20th data we find sub aspect/attributes going toward 'misfortune' and 'remorse'. Both of these are amplified by 'obstinacy' and 'standstill'.

In progressing the May 20th data forward we find that the primary aspect shifts from [force] to [dissolution/dissolving/spreading/dissipating]. However, in spite of the 'dissolving' nature of the force in the May 20th event, it will still dominate the rest of the year, at least up to the next event.

It would appear from the data when viewed from a date leading position, that 2005 will really get rolling around May 20th and pick up momentum from there. The indications are that while we have a few stress points over the next few months, that the last half of the year is showing up as the real 'show'. May 20th just seems to mark the entrance into this period of rapid and escalating changes, rather than a 'critical' event in and of itself. That having been said, it would appear that the May 20th period will be very distinct, and indeed can or will be used as a mental marker.

Note on Processing

Our data gathering shuts off at midnight tonight. We have approximately 55 million reads total with about half that processed at this point. We expect the next report to be posted by Monday, March 28th.

Note: Entities are identified by a blue typeface. Aspect words are enclosed in square brackets []. Attribute words/phrases are within parentheses (). Interpretive editorial comments are preceded by an asterisk \*.

Data set distilled from 38.91 million reads.

A note on processing.

Due to the way in which we process our data stream, entities can, and do, grow over time. Some do not, but most pick up further lexical links as we continue our data gathering and the processing leading to interpretation. In most cases the lexical additions are merely reinforcing trends already seen and perhaps discussed within the interpretation. In other cases, whole new categories of lexical associations become attached to an entity. In some more rare cases, these new additions take precedence from previously established primary aspects. This occurs as a simple battle of numerical sums from the various subsets of aspects and their supporting attributes. So if a new aspect arrives with many, highly emotively charged attributes, it will rise to become a primary

aspect, thus changing the evolving nature of the entity. We have a couple of those within this Part 3 report.

## Banks - It's all in the shells

Within the data set describing all things financial, we note a fully formed entity which we have characterized as Banks. This entity, while containing references to the Federal Reserve Bank and its ability to create 'money' from nothing, primarily seems to concern itself with commercial banks on a vast global scale. This entity, both in its internal cross links as well as external links is a mass of heaving change.

We see the change elements within the very first lexical set examined, the primary aspect (soothing)[subordinates] where the links, as the entity is progressed change from internal to external {primarily Populace} entity, and from marginally positive over to negative. The primary aspect also shifts and (soothing)[subordinates] is replaced with [decrease](abundance). In the development of this entity we note that the attribute set for (soothing) the aspect of [subordinates] contains the idea that [subordinates] are to be (soothed) in the (midst) of [danger], which will lead to [decrease] of the [wealth/material/abundance] of the [subordinates] as a (sacrifice) to their [masters].

In a strange cross link on the word (sacrifice) we find a connection to BushCo entity in which the attribute set would have it that (two/2) (ministers/advisers/counselors) will be (sacrificed) in (public) (ritual) to (save)(face/position). However, the Bank entity would suggest the sacrifice is in vein. Further, in reading the whole of the lexical attribute set cross links one get the distinct image of bank employees being used while managers escape. And it would appear, that the employees end up screwed along with everyone else. Within the Bank entity, the lexicon under [masters] shows that (once)[seized/obtained], [forever] (held). This will apparently be a 'point of contention' which will arise after BushCo sacrifices the two ministers as the Banks are seen as seeking (sanctuary) from the [labor] of the (populace)[stolen].

As is indicated in the internal cross links in Banks, and their cross links externally to both BushCo and Populace, we will apparently get to a point in which an actual, physical (rescue) under [force of arms/threats of violence] of persons, presumably directors, from a bank or other institutional building. The geographic indicators are for a location slightly outside Washington DC, and with a preponderance of words indicating 'north'. Within the image of the 'rescue', we find that the Populace within the cross links back to the Bank will take a building (hostage) by [presence] {suggestive of mobs in the street} in which the (pressure) will not let up, but also that [no one/none/no body] (gets in/enters/gains access). But, apparently it will take a troop of armed men to get people out as well. This event is seen as developing about one third of way through the process of the change of the Banks entity.

Within our modelspace, as we shift the data forward we note that the Banks entity alters its internal cross links, and almost all its external cross links. It numerically, within the total range of its emotive vectors does a 'reversal', e.g.- a 19 emotive sum becomes a 91 emotive sum. The obvious interpretation is that the Bank entity will, at a macro level, enter into a phase of 'reversal' as well. To support this conclusion we can note that within the Banks entity, we find a lexical sub structure which is led by [decrease] as an aspect and contains [decrease] of (oneself), (and/plus) [decrease] to (all) [others]. Further, [decrease] (comes) in (cycles) [occupying] (ten/10) [days]. And also cross connected to [occupying] as a sub aspect we find that [occupying] the [boardroom/controlroom/pinnacle] in (refuse/waste) and (smells/aroma/odor) come (roiling/boiling/tumultuous) (upward). And on the attribute of (cycles) we find that cross links to Populace show (cycles) of [poverty/depravation](begin) in [heat] of [summer]. And going back to (boiling) we note cross links to Populace which hang off of (boiling) as in [blood], and [rage/anger/hate]. Then other cross links off of (cycles) both internally within Banks, and externally over to BushCo suggest that [rage] (cycles) {riots?} will be (started/begun) by (lies/falsehoods) (blatantly) [said/spoken/printed/broadcast].

Also within the attribute set for Banks we find that [decrease] will be a [cloud] of (misfortune) hanging over the Populace through [spring] and into [summer]. Apparently the [heat] of [summer] won't sit too well with the Populace and things will get even hotter. Internal cross links within Banks go to the idea of [threat/risk] (moved/shaken/flung) onto [judiciary] (proves) to lead to [dissatisfaction/disaffection] for [government]. While mild in tone, the 'disaffection' also is a sub aspect whose attribute set is dominated by (misfortune), and further (rape) of (wealth), and (theft) of (labor) as well as less graphic indicators of a major level of decrease of the popular sense of wealth. Now along with this we note that the cross links from [judiciary] go back to BushCo and hang off our 2 ministers who will be canned. Within a sub attribute set of [judiciary] within the Banks entity we note that [ten/10] [judges] will (place/impose) [risk] on themselves in (acting/performing) as (good) and (faithful) [servants]. Apparently the Populace will see this [cloth] of [respect] {i.e. judicial robes} as a (sign/mark/indicator) of the [traitor].

What marks a distinct and expanding part of the Banks entities' reversal as it moves through modelspace is a complete aspect characterized as [shells]. Now at first the numerous references to actual shells such as 'tortoise' and 'conch' and 'nautilus' were thought to indicate a geographic location, but the predominance of references to 'shell' is being taken as an indicator for 'shell corporations'. There is still the possibility that it may be trying to indicate actual shells as a locator beacon, and if so would be pointing to Caribbean banks perhaps.

Within the references to [shells] as an aspect, we find the most cross links back to the Populace entity and the idea of [misfortune] and [theft]. Within that attribute set we note that [subordinates] are (told) (things) (will) go (well), and are (told) to (pass) (along) (lies) while (smiling). On the Populace side we note that the cross links end up in a section headed by [suppressed][anger].

Markets - Energy Bends, Secret Designs

Associated with our Banks entity, we note that our Markets entity has picked up a date ranged series of aspect/attribute sets in this last round of processing. We find that the first of April through to June 28 is the extent of the range, and that the primary aspect picked up is [energy][bends]. What specifically is being bent by energy is difficult to determine as the attribute sets associated with this aspect are voluminous {over 45,000 words}. We do see that sub aspects include [familiar][way](transformed) which is modified by (generational/long time)(cherished)(traditions/joys)(lost/gone) into (disappear/vanish) in the action of (period/time). The interpretation should be that some transition for the period of time that we are within, relating to energy, probably oil, will cause a serious alteration in the social structure this summer. The impacts seen in the cross links to the Populace entity are numerous. We especially note how many Markets entity originating links end up over in Populace hanging under the [danger] aspect which has risen to prominence with this Part 3 processing.

The [danger] aspect from Populace entity cross links is also seen in a pure form within several layers of the Markets entity. In one, more prominent layer, we note that a [blind](trust/group/association/man) will be (caught/exposed) (lying) about (their/possessive plural present\_) [structure]. This (exposure) will lead to a (hobbling) [wound] to [transporting](ligaments/threads). Also within the [danger] aspect is a sub aspect/attribute set going to [imposter] of (justice) is (discovered) in (waste). Further, this cross links back to BushCo and the Populace entity and suggest that the markets are going to be moved a bit by a discovery relating to (waste). And that a [blind] (trust) apparently ain't so blind and will be found out as such.

Some significant level of [violence] is seen as a sub aspect of the [energy][bending] and it would seem to begin with the month of April. Of course the easiest interpretation would be toward increased violence in Iraq especially involving their oil fields. Our [violence] aspect has many geographic references, none with any significant weight over any

other. However, bearing in mind our Oil entity in Part 2, and its connection to Armies, we also find that within our [energy][bends] aspect of Markets, we have a complete attribute set going to [warrior/soldier] and [battles] for [energy]. Apparently the early part of April will see actual battles over energy, and the impact of the escalation in violence will actually impact Markets significantly. The image suggested by the aspect/attribute sets in total is that energy will bend global markets from mid spring through at least until early summer. Further that violence around energy directly and significantly impacts global Markets. The suggestion is for the violence to (consume) much of the resources being contested. The lexical image is a pretty much net loss for all the players and the planet in general.

The date range would suggest a result of the early April developments continue to affect things more or less directly until the end of June. Further we find that as the entity is progressed through modelspace we end up acquiring more lexical support for this thread, as well as maturing the thread in general. Such that by the end of the specific range we see that the [invitation] to [danger] within the Markets was (taken/accepted) and as a result, (disaster) ensues. While likely not meaningful directly, we do find references to [plunge] and (plunging) being picked up within the data set. However, these are also held within the data set referencing the USofA dollar and may be indicative of that as a source.

What can be clearly ascertained from the modelspace is that as we advance the entity through spring and into summer it takes a distinctly 'bent pole' or 'sinking hull' look as it descends into our negative indicators territory. The whole entity suggests by its shape that the 'weight of the world' is on its back and it would appear that the back is about to break. This 'hook' structure develops its maximum height before May 15 and between then and May 28th we have a distinct change occurring. It is at this point that aspects speaking to [secret][designs] show up.

Within our data referencing the May 15 to May 28th period, we note two types predominate: the first is financial data, specifically focused on the USofA dollar as a currency; the second is the weather, specifically focused on continental North America. Within the financial data, all of it is either hung from or cross linked over to [secret][designs/relationships/ties]. The attribute set for this aspect would suggest that [secret] [designs/plans/plots/schemes] will be [understood/explained/exposed/expounded] which will [quietly] (begin) (crowd) [movement]. Apparently [one/1] will [go] for (each of/consists of) [three/1] which suggests that one out of three will be part of the initial [wave] of (parting/exit/embarking). This is also the seeming trigger point at which it becomes known that [secret] [ties] (untenable) (supports). And that a result is the (breaking/splitting) of the [corner] [pier/support/piling] while the [floor] (slides) [downward/backward]. Further the [house][ridgepole/beam/central support] (cracks) as (anxiety) at the (top/height) is (replaced) by (fear) and (unease) specifically focused on (cadres) of (special)(sort)(relationships) who are seen as being less than (reliable) thus leading to the (fear).

As a 'trigger' to events in May, we keep seeing a very curious structure develop within our data. This is one that is difficult to interpret in a meaningful way. It is a lexical set that is cross linked by most of the references to the May 15th to May 28th period, and is the most cross linked element for May 20th, and it is further cross linked from both our financial data entity, the weather related entities, and BushCo. But what is at the end of all these cross links? The [sun]. Yes, a strange, oddly doubled internally structure referencing the [sun] with primary aspect of [sun], a secondary aspect of [sun], and within each aspect's attribute set, you guessed it, (sun).

Within the ropes of cross links from the financial entities we note that the [sun] is going to act as a trigger for a shift to a period within the Markets and BushCo entities of [unanimous/cohesive][purpose/effort] all focused (upward) on [solar/sun] events. While not to make it seem a total union of purpose we do note that short attribute sets off the Markets

and BushCo suggest a period of 'dithering' in language such as [forward] (or/and) [backward] (makes/creates) (no/none). And further, (no)[relief] for [those/them/others] who (do not/can not) (know) (needs). Fundamentally an admonishment that 'those who don't know what they want, get nothing'.

Also this double [sun] aspect cross link structure shows other troubling signs of oddity. Within the primary aspect of [sun] we find sub aspects and attribute sets going to weather influences, but also a complete sub aspect/attribute set section going to financial or fiscal matters, mostly USofA focused within the attribute sets. These sub aspects include [trade], [currency], [investment/gambling/speculating], and [wealth][distribution]. In all cases we find a sub aspect or cross link which goes to [decrease/contracting] or an analog such as [shrinking] or [depressing]. Also in all the sub aspects we find (crisis) somewhere within their attribute sets. Again, oddly, we can also find [rain] within most of the attribute sets, but this may be there due to its emotive links to 'depressing'. Moving on we note that the [sun] will act as a trigger to [weather], which is likely the proximate cause to the [depressing] of the Markets in May, but it may be that a suggestion of open acknowledgement of the solar influence starts a serious shift in the popular consciousness.

It would seem that the tipping points described in Part 2, and the Banks section above, could be indicating that come summer, a solar storm or a geostorm, triggered by solar activity, and aided by exposure of 'secret designs', i.e. corruption, causes a shift in popular consciousness. It would seem likely that the shift in public consciousness will arise from some negative weather event, but perhaps the lexical structure is indicating that the public at large is starting to get the big picture and that for at least 1 out of 3 people we start to see significant alteration of attitudes....which in turn affects markets, energy use, currency confidence, et al.

It cannot be stressed enough that from the emotive sums seen within the tipping points as described in Part 2, and the current levels within the Banks and Markets, that a shift is underway. The lexical clues are pointing to a change in the entire global economic landscape. And the specifics indicate that trade, resources, and currency will be at the heart of the change. Further, the progression of the modelspace shows the impact of this change extending out as far as the furthest indicators within the model currently. That would suggest that these changes will start a large and jarring impact creating real change in peoples lives, perhaps with some suddenness, and then grind on for at least the next 16 to 19 months. The modelspace is quite explicit in saying that from our perspective, as of the end of May of 2005, the 'good old days' will be behind us.

### Iraq - Energetic Determination

It would appear from the many lexical cross links which can all be extracted under the characterization of Iraq, that we are going to be entering a [hot],

[energetic],[dangerous],[determined],[turbulent],[rushing],[frothing],[beating] period in which [fierce](determination) and [fierce](action) will [harden] [veins] on both sides, leading to [recklessness/risky] behavior, which in turn will [hamper] (movement) across the country as a whole.

A series of (four/4) actions are seen as arising in short order. Prior to these, and perhaps occurring now, someone is [studying] the (quality) of the (forces) and their [position]. A curiosity about the latter is that [position] is specifically being referenced as in lay-of-the-land, or natural position. Further we find that the four actions are all seen as involving or being connected to the natural position of things. In one case, some attempt will be made to use (rushing)[water] to (restrict) (movement). In another case, apparently some use is attempted of a [summit] or [promontory], but this comes to a bespoke bad ending in that the lexical set ends with [failure].

The increase in 'incidents' in Iraq likely do participate in the 'energy bends' aspect of the Markets entity, however Iraq does not dominate there. And curiously, within the Iraq sub set we also find references to 'energy shortage' with external cross links. These go back to an aspect in Markets under [water], and in BushCo are found under [sacrifice] in which we see two ministers being let go.

While there are all the lexical clues to battles won and lost, we note several cross links back from the Iraq sub set to BushCo which end there in [humiliation]. Further we find that the Iraq sub set when progressed through the modelspace ends up making a significant shift in primacy state by the end of June. We find that it currently is out at 104 and will shift over the next few months to 11. This suggests that Iraq will soon occupy much more of the broadcast time than currently seen. Again, the Iraq entity is also seen as taking a significant shift in primacy internally which is suggestive of some level of change of noteworthy status and long lasting/high impact.

Populace - Neighbors Unite, 3 Solar Storms, Navy - Energetic Activity, Destruction of the Past

Within the Populace entity, and heavily cross linked back to BushCo, and with minor links back to the Markets entity we find a section which probably is, or could be, referring to the 'Minuteman project' in Arizona. This section can be characterized as [Neighbors] which is its primary aspect, which curiously and rarely seen, is capitalized. Further the defining attribute for the set and the emotional sum value connection to our lexicon is (unite). Further we note that there are repeated references to [west], and [south] as well as [southwest], so seems a pretty safe interpretation.

We also find that a significant portion of this sub section of the entity is fully populated with aspect/attribute sets {suggesting a 'maturing' situation} and that the emotive values for impact, and duration are both medium-long, but the immediacy values for impact and spread {how far will the story carry?} are very high, near top of the scale. Now tempering this, there are several attribute sets which go to the idea that the 'minutemen' may be outnumbered by the press in their first stomp around as we find that the [Neighbors](unite) and through (natural) (affiliation) [draw] (more/extra/many/supplemental) [neighbors/relatives/clan/tribe/village]. They then (embark) on their [operation/endeavor] in (pursuit) of their (goal) they find that [press/journalists/reporters] are as (thick) as (roots) in the (lawn). But, in spite of this, as we move the modelspace forward we note that the [Neighbors] will (survey) the [situation/area/site] and (proceed) [cautiously]. Then a ? something happens, we see this section of the entity take a very rapid drop in one step downward, more than doubling its negative value from 9 to 19. After the something we see that this section of the entity has the aspects and attributes suggesting [hitting] a (rock) (wall). And that the [press] is (damaged). There after the primary aspect shifts to [decay/degradation/spoilage]. It may be that the Populace entity is indicating the first USofA border clash in over 90 years. The long term impact values of this section of the entity show a range of carry value that extends out several years. That is, it actually still has carry value when we reach the February 2006 end of our current modelspace.

### 3 Solar Storms

Also within the Populace, we find a very large section of the entity that grows as we progress the modelspace forward into spring and summer. Within this section we find hundreds of cross links back to the [sun][sun] reference within the Markets entity {as detailed above}. Within the Populace entity we find that this section also has [sun] as a primary aspect, but its secondary aspect is [storms] and the primary attribute for that aspect is [three/3]. What is curious is that this reference

is within the Populace entity and not within the Terra entity. However on closer examination of the surrounding aspect/attribute sets we see that they go to the idea of the Populace 'enduring' the 3 solar storms in [one/1] (solar day). The majority of the attributes relate to the emotional burden these storms put on people. These attributes also contain references to [shelter] (all day) and that [risk], [danger] are associated with (outside). We also see that the Populace entity will (lose)[communications], and that it will be (unsafe) to be [out of doors/outside/exposed] during these storms. Further that the Populace will (come)(alive) as [night](falls)(safety).

However, we note that the primary aspect for the [weather] will be [wind] and we see that these [solar] (storms) (generate/create/spark)(electricity) which is its own hazard, and is [illuminating/lighting] the skies, but primarily, the electricity is seen as driving the [winds].

Here again, though within the Populace entity and primarily focusing on the suffering and emotional problems inflicted we see references to horrific winds which [spend](themselves) (only) (relenting/ceasing) after (encountering) the [mountain]. But, sadly, it would appear that the winds are so strong that not even the mountain survives unscathed. We note that hanging under [mountain] is [winds](lift/rise/elevate)(boulders/rocks) to (distant) (ridges) and (scour) the [treeless][tops] to [rock] [bare] in the [sunlight]. Further, another linked aspect/attribute set goes to [dust] (rolling) in [wagons/cartloads] (over) [trees] and [homes].

The Populace entity does go on to house aspects/attributes which suggest that the wind storm will far less severe on the eastern side of the mountain range, and that while devastating, and damaging, its greatest effects will be on [shocking] [awareness] rising in a huge percentage of the Populace. We see that after the [winds], fully 4 in 7 will (shake) their [fists] and (express) [anger] at their [masters]. The slave revolt begins

with a [wind], and rises as the [wind] (settles) [gently] after (scrubbing) the [mountain].

## Navy - Energetic Activity

We also note within the Populace entity a series of intricately convoluted cross links between Populace, BushCo, and Terra. If we examine the cross links as an extracted set {there are thousands of them} we can see that they are primarily referencing the [tension] both active, and as a state, that the USofA Navy will place on the Populace of the USofA. This is not to say that the USofA Navy is going to turn their guns on the countries populace, but rather that a very tense situation will develop around the Navy which will place the Populace into a [knotted] (stomach), and [burning][bowels] state for a few days. It would appear that this is an 'incident' that develops, rather than some form of long term confrontation. In point of fact, we cannot even say if this is conflict or if the problem arises from a natural cause such as the solar storms indicated above.

What we do have is a primary aspect of [USOFA][navy] and all kinds of 'deployed ships' references which all go to an aspect/attribute set of [in situ/on site/ locale'] [tension]. However, there is also a very curious group which goes to [holed up/hidden/taking refuge] in a [cave] (with/sans/together/as a group) the [enemy]. So the indication is that for at least some period of time the navy will have to 'ride it out with the enemy in a cave'. Now the obvious interpretation for this coincides with the solar storm material above, and given that solar storming has caused communications failures in the past, we could see a situation in which the navy is out of contact with the folks back home and this is the cause for the knotted stomachs. This would fit, as the modelspace when advanced, shows that after this period of 'hiding in a cave' the aspects shift to [rapid movement], and [explosive] (action). However, these are not combatively accented in any way at this time, and instead show more attributes toward motion, than fighting. This suggests a 'run like hell for home' kind of a response to the 'release from danger' and the cave.

We also note that the 'waiting in the cave' will be done in which 'all stand ankles in blood', but that in spite of, or perhaps because of the blood, a [bonding] emerges which will become [public] and (shocking). Somehow, the [uniting] of (bondsmen/bondsbrothers) under this cave circumstance is seen as having a very large carry value even though the initial impact values are small. These impact values rise as the model is progressed suggesting that as the story is circulated some significant reappraisal of the situation is begun. There are also several threads linking back to the 'rebellion' aspects seen both in Populace and in BushCo.

In the nature of reading the attribute set a small story emerges.

We see that 3 energy receptions will force waiting in a hole in the ground {cave} and that many uninvited guests will also seek shelter in the USofA Navy cave. These will be enemy but the determination will be made to allow them in as truce in the face of the 3 energy receptions covering the region. Every one of the enemy is happy at the respectful reception. Arms are placed at the mouth of the cave voluntarily. Then in the shelter, enemies prepare food and plan for mutual survival. A bond grows. In the meantime, the USofA nation has burning bowels likely due to communications failure. Sensible and correct behavior on the scene ensures success but no one is able to determine this elsewhere. Alarms are issued, but soon becomes apparent that they are moot as the nation is helpless to respond with aid as it too must shelter.

## Destruction of the Past

We also note within the Populace entity that while the primary aspects are still clustering around the idea of 'numbness due to shock' as we saw in ALTA 105, we do see that, as the modelspace is progressed through spring and into summer, a new primacy candidate is emerging. This is

being labeled as 'destruction of the past' for its most vivid image available within the primary aspects' attribute set.

This section is both troubling and reinforcing of areas already seen. The primary aspect of the Populace entity will shift this spring and summer to a point indicating a new [awareness/consciousness/expression/manifestation]. This [destruction] of the [past] aspect is troubling as to its detail. It seemingly reinforces the idea that the next big 'thing' to move the Populace entity will quite actually be the 'shift of the crust' which will, of course, physically move the populace, as well as indelibly move their consciousness as well. We saw the beginnings of this 'mass consciousness shift' late last summer, and believed its impact to be arriving soon after last fall. With the tsunami of December, we think the conditions to be complete for that movement seen last year. What is arising now is perhaps best characterized as the 'next step' in the evolution of consciousness about the fragile state of life within universe and specifically within our solar system during this period.

The aspect/attribute sets which the Populace entity acquires as we move the model forward through spring and summer shows that public attention will be turning to such things as

[earth][crust](closes)

[lookout][post](breaks/tears/crumbles), (many)  
(injured/damaged/harmed) by (tower)(legs)[cracking]

[dead][ruler](lay) (on top of/superior to) [rock][bed], and is (tumbled) to the [ground/earth], as the [sky] [shakes]

[unfavorable][movement], (lid) on the [ground/earth] is (cracked)

[blooming](fungus) on [decay][exposed] by [earth][crust](closes)

[sources] of [strength] (stir/waken) (with/sans/together)  
[earth][crust](splinters/shards)

[people/populace][many] (embark) on a [new](fleeing/fled) to the [east]  
and [south east] with [new](energy)

[strength] is (transformed/alterd) to [fear][words/verbiage/discussion]  
by [earth/ground] [destruction] of the [past]

the [seasons] of the [earth] (all) (arrive) in (seven/7) [days], and  
[destroy][past][regime] of (dominance)

The attribute sets continue growing with similar items relating to the crust of the earth moving, and in so doing, destroying the past. This would suggest an interpretation of a quake large enough to alter the infrastructure of a significant human habitation, and as is suggested by the run to date, create a large number of refugees.

We note that there are several aspect/attribute sets which go to the [destruction] of the [feet/carriers/movers] and the actual statement from a supporting attribute set that the [destruction] of the [feet] (makes/creates) (life) on (earth) (becomes/develops to) (hell). Within the sub aspects of this aspect set, we find further references suggesting that the refugees from this destruction of the past will be known for stating that emotionally they 'envied their unburied dead'. Within the refugees emotional stories after the fact will be heard frequent references to 'humanity lost courtesy and righteousness', and that the 'mass of moving people' were like an 'ocean of burdened ants'.

This movement to primacy of the 'destruction of the past' aspect brings with it many emotional state references both bespoke and through our summation of the emotive values of the new words which are acquired by the entity as it moves through time. This primary aspect has numerous supporting aspect/attributes which paint an image of the people who experience the 'destruction of the past' being so 'shocked to

the core' that many share a trait of not being able to cry for years. There are also references of stumbling around in the dark on long roads filled with debris of all kinds, from the buildings and other infrastructure of the area to eventually all those things once carried but discarded once the refugees realize that the 'only help is within'.

We also find a supporting series of attributes suggesting that while the Populace is busy being moved, at least emotionally, by the destruction of the past, that the powers that be are occupied elsewhere, and that as a result, no real aid is available for these sufferers. This aggravates the situation causing the 'long roads out' to become areas where 'evil dwells', and 'bones are pulled apart', and that frequently a shallow hole in the ground was both 'bed' and 'grave'. Not nice images.

These continue though, and further go toward suggesting a very real and at least within the region affected by the crustal movement, a very significant breakdown in social order. There are repeated references to 'those who stay' being 'destroyed', while those who leave face 'misfortune' and 'trials'.

Also in within our cross links from the Populace entity over to the Terra entity as both are progressed through the modelspace we find that the Terra entity also has gains similar aspect/attribute sets as it is progressed. Within it we note that the area will be so shaken that 'not a single bed will have an unbroken leg'. And that the 'broken teeth of buildings/structures' will be seen globally as the image of the event.

We also see that this event causes the [formation] of (new) forms of [social context], both within the group which experiences the event and within the larger Populace globally. As the event is seen progressing, the sub set of the Populace entity which relates to the peoples' experience with the [press] shows that several large movements are also occurring in this area. First we note that the 'press rebellion' reported earlier is starting to 'blossom' by mid spring and into early summer. This is further supported by the Populace entity containing references to a 'flowering'

relationship between the press and populace. Also we see a minor subset of attributes within the press section which suggests that a common bonding theme will be the idea that the 'army' is 'unavailable' and is being 'wasted' as a rallying cry by both the populace and press demanding to know why there is no aid forthcoming to the refugees.

## BushCo - Rising Pack of Dogs

As we move the modelspace forward through spring and summer we find that BushCo aspects also progress through a significant change. We have several developing 'threads' competing for top-dog position as primary aspect. At this point in the processing, and as far as the model can be extended, all have the same total emotional sum so none yet is primary. We have as candidates a [border] (full) of [weeds] with a primary attribute set containing, 'rules not yet grasped', and 'concept not yet understood'; then there is the second developing aspect of [strength][overestimated], supported by [traveling](curtailed) and 'goods not delivered to the needy/starving'. Following this in the developing race for primary aspect is [animosity] (arrives) when [support/help/assistance] is [sought]. This being closely followed by [alone] and [weak] it [rains] on [head] while [feet] are in [bloody] [mud], then [partisans/indigenous peoples] are (encountered). This last also contains an explicit reference to [ass/butt] being [whipped/grazed/peeled]. Then, last but certainly not least, is the developing theme of [sheep][flock] (lost) to the [uncomprehending](listener).

The candidates for primary aspect noted above are seen within the modelspace as being acquired over the course of spring through summer, but the effects in terms of the carry values of the emotive summations of all the aspects competing for the position show that these all will to some extent 'dog' BushCo through the rest of the year. We can, within the model, as dictated by the pre-assigned values of various verbs and adverbs and adjectives, project a time frame on lexical changes being seen. This is how we extend the modelspace forward as we go through

the processing. At this point our total scatter graph of lexical points extends out to about end of February 2006, however the mass of the points only reach out to about October at the fringe with the real coverage going out as far as say mid July.

In support of this time frame we also note that explicit date range references which make it through our processing currently show that BushCo will be set upon by these above described 'dogs' before July 4th. And that as a result of the 'shredding/erosion/deterioration' of the relationship between BushCo and the Populace by July, that the basic descriptor for this holiday is 'split apart'. We find that a sour note is going to overwhelm this 4th of July, USofA Independence Day holiday. This emotive note is shown as being one of (deep)[division], with most of the [people/populace] being (self-occupied). There are several explicit references to 'shunning' as though an organized, at the grass roots level of the populace, movement toward shunning government sponsored events will take place. It might also be interpreted though as a general shunning of celebratory events in light of recent developments. Indeed, given the nature of the problems seen within this data run, the latter makes the most sense.

The rising pack of dogs besetting BushCo this spring and summer are linked by association to a period which really starts on April 9th and moves in a saw-tooth fashion of minor problems developing until the May 20th period is reached, then the general emotional note is 'downhill' and the saw-tooth still continues, with each of the daily problems compounding those that have come before. Further we find descriptors indicating that all [efforts] will [fail] due to [care] to (redress/revisit/redo) the (specifics/details) (causing) [lost][sight] of the (core) or real issue. This aspect of 'missing the real point' is also supported by attributes going to [stubbing][toes], and [missed step] as well as explicit [mistake] references. We also see repeated statements within sub aspect attribute sets that the efforts are [not] (equal) to the [task] in one form or another.

A troubling aspect for BushCo is that the May 20th developments are part of a tipping point and there after a significant portion of the cross links back to the Populace end in attributes such as 'fling mud' and 'bespatter' and 'yell against' as though echoing the developing rift between the 'government that just don't get it' and the 'populace forced to live through it'. Whatever the it might be. We do see a fundamental global economic shift developing which easily could account for the split between rulers of state, and subjects to state, however there are other, more obtuse emotional values involved as well. We find references to 'five judges who sit in a marsh, dry on hand hewn decks'. Such teasers are joined by 'skin is tested by touch' and 'fingers find fault' which are all within a higher aspect/attribute set of the 'border of weeds' which are seen as a barrier of 'insuperable obstacles' which 'cannot be climbed'.

### Food - Double, Double, Plenty of Trouble

In the course of our processing tendencies toward duplication are rigorously sought and excluded. Redundancies are noted, but not duplicated, merely summed as we go along. This reduces the amount of the lexicon that we have to review in the interpretation. Therefore, when doubles actually show up after our processing, we take note.

In this case, around the concept of the human food chain, we have a doubling at several levels. Not only is the primary aspect doubled in the secondary, but so are the primary attribute sets and sums for each. Further, as we progress the model forward, we find that the various doubles also seem to grow at the same levels and same time, again, a doubling of their growth patterns. In our past interpretations we have taken this to indicate a real strong potential for a manifestation to fit well with our lexical set.

In this case we have a number of doubling's around Food. Within the doubling we find that [water] will be the center for the problems with food at a number of levels, some more obvious than others. Immediately

with a time frame of this summer, we find that aspects of [standstill] with regard to food, and [obstructions] with regard to delivery will, as we move the modelspace forward, change to [perseverance] (carried) (too/excessive) [far] leading to images of [trailers/carts] (floating) (away) on (muddy) [waves]. This water is seen as [rainwater] and as as [obstruction] which will [test/try/trial/challenge] humans in delivery of needed supplies. There are other aspects of water within the Food related lexical structure as well.

One of these references to water is seen a bit further out and is viewed as affecting global food production this year. The problem is with [water] both rain, and sea, being not where it usually resides. We find references to global deserts starting up, as well as places which were deserts only last year, having so much water this year that [fungus] grows from (sodden) (sand). The continued references are to both drought, and fungal diseases laying waste to global grain and other vegetative crop productions {with some exceptions}. This view is reinforced as the modelspace is advanced and we see that public outcry for solutions and (surety) will instigate an emergency conference on 'global daily food ration' late this year. Now we must note that we are taking some liberties with the interpretation here, but we also need to note that there are large areas of the food problem(s) both the initial 'standstill' of deliveries, and the later collapse of the harvest which are cross linked to BushCo and hang off the [rebellion] aspect seen beginning in early April.

The modelspace suggests that humans will be looking at the near total collapse of global food fisheries this year. Further that as much as [one/1] (grain/seed) in [three/3] will be [contaminated] by fungus and un-useable. As a side note, some bright person will put all the bad grain to use as fuel such that [tainted][seed] (burns) (day/daily/all day/continuously) for nearly a year. Along with the lack of harvest, we also need to consider that the Food related lexical aspect going to [transportation] is full of repeated references to problems. These impediments to delivery range from [weather][winds], to the apparently [rivers] of [ocean] which are sucked up into the atmosphere to be

delivered to just the wrong place. We also find that [fuel] problems have their own, very extensively populated thread. Here we are also seeing many inter-layer doubling of activity numerically. The suggestion is from the data that fuel shortages and high prices will set off their own comedy-of-errors chain of events including the use of (contaminated) [fuel] that somehow results in a multi-state chase or [hunt], as well as many instances of [villages/towns/communities] being left [bereft/absent] of [vital] [supplies] due to [imposter/imitation/copy] [fuels].

## Metals - Precious again? Seductive to Vital

Within the processing of the data for the Part 2 and Part 3 runs we note that previous indications of a global awakening of interest in metals as a precious commodity is emerging. This is not a 're-awakening' at least not within our data as what is seen developing is a [first glance/initial appraisal/contact] (infatuation) for large numbers of people who have never contemplated other than currency as a wealth storehouse.

We examine the lexical threads relating to metals as a precious commodities and a very clear evolution is seen in aspects and attributes as we move the modelspace forward over the course of this year. We find that in the initial period of 'infatuation' which apparently will begin {or has begun} in early April, Precious Metals are viewed as 'seductive', and along with that, a certain 'tenuousness' language creeps into the various aspect/attribute descriptors. However, as we move the modelspace past our developing fuel, food, and solar crises we find that the language associated with PMs goes from the tenuous expressions of seduction and teasing to the actual statement within the aspect/attribute set as [vital] (to life). We also find emotive sums that go back to the lexicon and provide an image of a emotional shift toward [desperation] to [possess], and [possessed] (by) [desire] such that [bones/rags/discards/jetsam] will be [curried/combed] for any possibility of PMs. One of the more depressing aspects suggest that this combing through the bones will take place within long line of 'weather' refugees.

Again, echoing back to a developing theme seen within the data this year.

## Word Shift

In processing our data, we work against a now very large lexicon. Each of the words or phrases has a previously assigned value for a number of different parameters. Almost all of these are emotional in nature, and some, such as 'impact' and 'carry value' indicate how the emotional tone changes over time. We use these as our timing clues for setting the parameters for the modelspace at any point within the processing.

When we process part one for instance, we are working with a clean slate as far as the modelspace is concerned with the viewer of the model space standing at the left most edge, or the 'present'. At that point, most of the references are 'ahead' of the view and stretch off into the future in our little 3D box. At that point we are still collecting data as well. Our data collection stops usually between part 2 and 3 processing as we have filled our bandwidth limits and are busy processing. This means that we now are looking at a snapshot of lexical changes which are no longer 'real time' developing and represent a static view of a very dynamic thing, change. So from part 3 onward, we race against the 'decay' of our values as time marches by our now frozen data set. Usually part 4 interpretation finds us just being 'caught' by time moving up to the period described in parts 1 through 3. Part 5 usually picks up the minor elements not examined initially but now deemed interesting due to backward seen cross links.

At this point we have finished the part 3 processing and interpretation. We do note a strangeness within the data which is clearly explainable by the tsunami and resulting attention paid to all things earth related. The strangeness has to do with a sudden rise in the number of words taken in during the last of our data sweeps which relate to the 'shift of the pole' or the 'pole shift' or the 'magnetic pole shift'. Understanding that magnetic shifts happen all the time, we still note a 1000 per cent increase in data

reference points within the Terra entity about 'pole shift' now as over the initial processing within this run. Further, the initial processing for part 1 has totals that are nearly 100 per cent greater than the totals for the same subject seen in ALTA 105 processing. So this is a general rising trend in 2005 that has taken a sudden jump. We just noticed this in the data processing already begun for part 4 and expect to lead with that entity description when part 4 is posted on April 4 assuming that it is not merely a fluke of the early part of the processing.

We also note an increase in reports of UFO's in both Mexico and SE Asia. As noted earlier, these are likely very real indicators of potential large scale climate/weather/earth problems in the area.

Data set distilled from 49.87 million reads.

Silver - Primal Energy

As we noted in our update this past week, Silver, has formed up as an entity, albeit small, and is in the process of going through an emotional tipping point. We find that the silver related entity within the modelspace forms up into a 'cannonball' shape and moves from a marginally positive reading of 15.75 up to 345 over the progression of only a few weeks within modelspace. These are positional indicators within the modelspace with zero being emotively neutral.

When progressed we find that within a short period of this Part 4 being released, perhaps only days if it has not happened already, silver will form up emotionally in the sense that large numbers of people will begin to shift from a marginally positive view to one associated with 'possessiveness' and 'acquisitiveness', and relating to the aspect of [desire].

Now, once the 'cannonball' that is the silver entity forms within the modelspace, it moves ever more positive as we progress forward over the next few weeks. At some point in the near future, it starts a rocket-ship like rise at a near vertical direction. Some of the few timing clues to this period are seen in the sections below. However, even given a clearer indication of when silver might move dramatically upward in emotional 'tone' with the general populace, we also have to note there is not an end-in-sight. That is, there is nothing to indicate that a reverse shift or pullback in emotional context for silver will arrive any time soon. In so far as our modelspace is concerned, it extends nearly to end of March of 2006 and still within that context we see the emotive values of silver continue to rise, albeit more slowly once it reaches the near vertical.

Interesting lexical associations rise with the Silver into the vertical in that while positive for silver, we note within aspect/attribute sets that [excess][energy] for [silver] will (associate) (damage). The damage seen with the attribute set is extensive and comes from a variety of places. We note that [seed] [sellers] as a minor aspect, with attributes confirming companies such as those which modify seeds genetically and

patent such will find that the sudden rise in silver prices are very bad for them. While the mechanism for this association is not clear within our data, the conclusion that rising silver prices are bad for GM seed providers is clear. As are rising silver prices also seen as damaging automobiles as an industry both directly and through [fuel]. We find that one of the largest impacts of a rising silver price will hit the geopolitical areas. We find large numbers of cross links from the silver entity over to BushCo, the Populace, and the Armies. Within the BushCo and the Populace entities we find many cross links with silver which go to the aspect of [corruption] with primary attributes of (exposed/revealed). And within the Armies entity, we find that [fiscal/financial/currency] (problems) [exposed/revealed] by the [silver] (rise) will (cause/create) a (cascade/waterfall/tumbling) within the USofA government structure. Likely this latter is referring to DOD/Pentagon, though there is less clarity here.

Counter pointing to the [damage] aspect of silver rising, we also note many sub aspects of beneficial impacts. We find that rising silver is seen as [leveling] and [restoring] some [surety/confidence] after the coming large [corruption] scandals detailed below. This restoration of (confidence) and (emotional)(surety) will (allow/mitigate/modify) much in the way of [lost] (structure) within the context of a (decaying) [financial](system).

There are, as may be expected given the rapid positive rise in position of the silver entity within modelspace, many words associated with silver which as aspect/attribute sets go the idea of 'good fortune' or 'fortune to be made' or 'hidden treasure revealed' or 'sparkling luster of wealth', and other in similar vein. These are all fully completed aspects with their attribute sets 'finished' in the sense of fully populated, completely cross linked and passing all self-referential testing.

The overwhelming nature, by sums, of the positive emotive values associated with silver are the drivers behind its move within the modelspace. As indicated by the coalescence around silver, that is, it

turing into a tipping point 'cannonball', we will note that in the immediate future, silver as a commodity or as a monetary substance, will enter the mainstream media's attention, and given the nature of the rise of silver within our modelspace, the silver 'cannonball' will stay within mainstream media's attention for some time. Further we find that all the cross links, even those ending in other entities in negative emotive summation territory are all positive within the silver entity.

Further we note that as we move the modelspace forward in time, that the Populace entity takes on a decidedly [receptive] emotive tone as regards silver. Within the Populace entity we find that the primacy state descriptor value shifts down (good direction) to a 1/one. This is from a usual range of around 90 to 118. A shift of this magnitude is what is responsible for the tipping point appearance within our modelspace. A shift of this magnitude, in so far as our experience in interpreting these lexical data extends, is indicative of perhaps the remonetarization of silver, either directly or de facto.

### Populace - Innocence Shouted, Feet in Corruption, July Fireworks

We have an oddly altered Populace entity this run with it directly reacting to the movements and changes within other entities. We find for instance that cross links from [corruption] within the BushCo entity over to the Populace entity end at an aspect/attribute data set which goes to [innocence][shouted] but the populace will apparently view the protestations of innocence of corruption as [duplicitous/shielding/lying/hiding] [words] which (arise/spring) from (feet) (standing) in [corruption]. We note that the Populace entity will view much of what is 'shoveled' their way over the next few months from official sources as being [words] (covered/wrapped) in [mud] {or worse}.

We find many emerging lexical clues that the Populace, as a modelspace representation of the people-at-large, will begin to show distinct signs of [disbelief] and [cynicism] on all pronouncements, large or small, from

any sort of officialdom. Apparently, as shown within the Populace entity an [insincere] aspect to (proffered) (acts) of (humility) by BushCo will result in (repercussions) from the Populace as the [waves](tidal) of [disbelief] (roll) (over) the [people] and (reflect) (back) as [derision/denigration/ridicule]. There are [two/2] distinctly separate 'events' or incidents relating to [humility] (falsely) (offered) by (officials/ministers/government) which will rise to the level of becoming (bespoke/named/labeled) public meme {eg- the 'wardrobe failure' incident with Janet Jackson}. In the case of these two offered [faces] of [humility], in at least one of the two incidents, the [face] will be (impelled/driven/forced) from the (stage) by [fear] of the [reaction].

Further, we find that the Populace entity is indicating a major change in its relationship with the [words] of (control/issuance/statements) that come from 'on high'. The Populace entity is showing a pattern of lexical growth around the cross links which originate from other entities. In effect, visually, within the modelspace it is as though the Populace entity is 'layering' the links that come from these other entities. It appears very much organic in nature as we progress the modelspace and the gut-level image is one that might be seen on a science documentary in which the bodies' defenses attack the invading pathogen. The visual impression is very lasting and striking. We have never had such a movement within the modelspace as we have had with this run. This particular bit of strangeness joins our now three tipping points for discrete entities to make this run the most significant in over all emotional changes that we have seen since we started work on this process in 1997.

The layering around the cross links is accomplished by repeated attachments of more aspects/attribute sets as we progress the entity through time. It is as though the Populace entity is (digesting) the (mud)(covered) [words] and is isolating them from the rest of the entity through another layer of attributes. For the most part, we find that the attribute sets which attach to these cross links are increasingly negative as each is added on. Again, a never before seen effect. For our interpretation we view this effect as one indicative of a deep penetration

of the words into the populace. We see this as a period in which the Populace is actively seeking leadership, and is hanging on every word. Further we see this as a period in which large segments of the populace who usually do not care about politics per se are now joining in and hanging on every word. Unfortunately the (judgment) of the [plebes/plebeians/crowds/street population] is very negative and all their emotive responses hang from a dual aspect of [betrayal] and [disappointment]. Within this aspect/attribute set we also note that the terminating attributes are (bitter), (negation), (revenge), and (criminal).

An internal cross link from the terminating attribute of (criminal) goes back over to Enron which is showing up within the [corruption] aspect of the cross link response to the BushCo entity. The supporting attribute sets show that a battle will be waged over the coming few months. The goal of the battle is seen as the [attachment] of (trash/waste/refuse/discards) to BushCo, or not. The cross links show that a predominance of opinion will emerge linking Bush administration personalities with the Enron crimes. On the BushCo entity side we note that the originating aspects/attributes sets hang from a primary aspect of [fear] and that the dominate attribute set is led by (exposure). As a note for point of accuracy, we find that both the BushCo entity, and the Populace entity, within the attribute sets supporting their mutual cross links around the subject of the Enron crimes, we find that repeated references to human body parts or functions emerge. This has in the past proved a reliable indicator of emotional strength of the situation, and thus, a reasonable indicator that the described conditions are likely to arise both with some immediacy and with some strength in the public dialogue or within the press. Within the BushCo side of the cross links we do see repeated re-statements of the idea of (twisting)[guts/intestines] and (writhing)[bowels] and others of the same ilk, all hung off of the [fear] primary aspect. The more obvious interpretation of the data structure is that it is suggesting that this spring/summer BushCo will mount an offensive to try to 'de-link' the Enron crimes from BushCo. Further, this will be clearly seen as such an attempt by the Populace, and that, as indicated within the Populace entities numerous layered attribute

sets, the 'de-linking' will have precisely the opposite effect. It will apparently clearly cement BushCo and Ken Lay/Enron Crimes in the minds of the Populace. Further, this link will join those already building in emotional intensity and this link is also cross linked internally over to [rebellion] within the Populace entity. Note that the use of the word 'rebellion' is as an emotional indicator and does not necessarily mean an actual armed citizenry cleaning house of a 'corrupt politician class'. However, we do note that just such language does arise within the lexical substructures.

We also find within the Populace entity a very curious structure with links back to Terra entity and to Space entity. Within the Populace entity we are seeing the emotional reaction to events or circumstances which will impact the Populace this spring and summer. We note that the Populace will come to be [terrified/frightened] as their [first/prime] response to any new [weather] news, such will become the climate of the planet. We also find that [weather] this summer, as an aspect within the Populace entity, contains a completely populated aspect/attribute set regarding [fireworks] in [July]. Now we note that rarely do we get dates as aspects, and that this particular monthly reference emerges as a cultural association within the USofA and Independence Day celebrations, also known as the '4th of July'. In this particular instance, however, the interpretation must be against actual fireworks and more toward the idea of a large, and clearly visible reaction to NASA blasting a large copper clad shell into a comet. While the experiment in NASA's statement is to confirm the 'dirty snowball' theory about comets, it would appear that the Populace entity is suggesting a very spectacular failure of that goal that may actually result in (visible/seen/reported/filmed)(space) based [electrical] (circuit)(disruption/disengagement/short) which will involve the [sun]. Clearly within the lexical set is an image of the Populace being (impressed) (beyond) [words] with the [electrical][accident].

We find that the Populace entity shows its reaction around the cross links emerging from the Terra entity which hang off the aspects of

[alert],[energy](awakenings), [daily/all day/morn-2-night/dawn-2-dusk], (hesitant)[beginning] (yields)(electrical)[finish]. Further we find that the Space entity contains references to [motion](arises) from (copper/metal/ore) and that (gentling)[motion] is (unsettled) by [strike]. We also see that cross links from Space back to Populace show that the Populace will (see) a [light] (perpetuate) [itself] and that (excitation) of [internals] will result in the (expression/manifestation) of [lightning]. Other than the cross links back to the Space entity there are no indicators as to where the lightning will occur. But the impact is seen by the modelspace as (altering) to [understanding] within the Populace entity. Further, the Populace entity shows that the [effect] of the (seeing/viewing) will (cause/affect) those (wallowing) in [material][affluence]. Also that the viewing of the (disturbance) will significantly (alter/change/modify) the (global)[balance] of [power] at all levels. The whole of [officialdom/government/power structure] is seen to (ripple) with the [waves] as the Populace [responds] to (movements) in Space.

### Terra - Summertime Shakes, Energy Awakened, White Flowers

We find within the Terra entity an aspect relating to [earthquakes] in which the attribute sets are very full, as might be expected given recent events. Within the [earthquakes] aspect we note that the next (great) quake is seen as being very deep in origin, and [crustal] in nature. That the [crust] (breaks) and that [fluid] (vibrating) (under) the [solid][mountain] (causes) [thunder/noise] to (penetrate) the [world/planet]. Further there are indications that this is a summer time event in that there are numbers of celestial references which are indicative of northern hemisphere summer view of stellar/planetary positions. Beyond this, and some minor cross linking to the July 4th period, we do not have any particular date range showing up within this attribute set.

We do see that the set contains references to [rocking][crust] (shuts)[down] which is coupled by cross links to 'power plants' over in

the Populace entity with references to 'nuclear'. So the obvious interpretation is that our summer quake will cause nuke plants to trip and go to shutdown mode. Further within the Populace entity we find that the [fertile world/agriculture] will be (cracked) like a [seed], and that [plants] which (feed)[men] and [beasts] will be impacted by this cracking. The attribute set goes on to suggest that the summer time quake will change agricultural patterns both where things grow and, from a cross link back to the Terra entity, the [weather] patterns that allow them to grow where they do, or at least, did formerly.

Within the very 'plump' Terra entity we find numerous minor aspect/attribute sets which act as supporting descriptors to the earthquake. These include (buildings)[dangerous][rocking](fill)(streets) and (incapacitate)[transportation]. That also the [foods] and [vegetation] are (altered/modified) and that (proper) [nourishment] is now (at risk/questioned). There are supporting attribute sets within the Populace entity which are cross linked back to the Terra entity and go to the idea of some form of [food](rations/rationing/moderation) will be seen at least at the local level impacted by the earthquake if not more generally imposed. Again, within the context of last years' reports we saw the general idea repeated of 'dangerous water' month after month, and then in December the very devastating tsunami. It would appear that one of the repeated themes of the reports this year is 'restricted food supplies'. We saw such language in ALTA 105 and now are seeing it repeatedly within many entities in this report. It may well be that what is being encountered is the leading edge of a situation or circumstances which will develop later in the year which will have the same sort of global emotional impact as the tsunami, but will be focused on food, specifically vegetation, that is, human food plants. It is always dangerous to predict trends with only two data points (ALTA 105 and 405), but within this context, we have had the number of references to food plants jump over 10 thousand percent in just one year (January 2004 to February 2005). All of these references are hanging from our [restricted] aspect which is augmented by the primary, dominant attribute of (movement). Within the many attribute sets hanging here we

find details of what could be described as separate, but inter-twined conditions. These included the [rainstorms] seen as impediments to movement of food, as well as the now emerging summertime shakes. Leaving aside such details, we perhaps should focus on the emerging design pattern of restrictions on the availability of food and food types which is currently seen as being of long term duration within our modelspace. The entities continue to show dominating trends toward restricted food plants as we move the model through time at least as far as we are able to currently project which goes out to about February of 2006.

The Terra entity also has several aspect/attribute sets within the Summertime Shakes subset which go to the idea of [energy][awakened] or [forces](released/unleashed/exposed). Further we find many poetic references to [thunder] [deep] in the [earth] (pulsates/vibrates) (unnoticed) prior to the quake and there after images such as (vibrating)(fluids) (shake/tremble) [terra/planet earth]. In support of these images we also find aspect/attributes which describe the 'well of energy being uncapped' and the 'lid coming off the boiling pan'. Further find that 'vapors/steam will rise from the cold depths' while 'ground shakes like pudding'. Within the modelspace, as we advance the Terra entity, the accretion of lexical values both raise the impact level in a rising fashion, as well as extend the duration values. So we have the Terra entity suggesting that the summertime shakes will have a very long duration of impact as a result of altering conditions such that 'energy flows' where before it was 'capped/lidded/sealed'.

The references to [energy] abound within the Terra entity and are being interpreted as in the past as references to 'natural energy' such as may arise from universe. When we find aspects of [energy] in the Populace entity, this is taken as energy within a social context and is usually interpreted {absent modifiers indicating otherwise} to mean a 'shift' in a large number of persons' emotional response or state. When we find energy within the BushCo, and again absent modifiers to clarify, this is taken as referring to political energy or the visible manifestation of

diplomatic moves. When energy is referenced in other entities such as Markets, it usually is further clarified by descriptors. Currently within the Terra entity we find that the aspects for [energy] are cross linked back to other entities in which the [energy] aspect changes its nature. This is to say that the [energy] reference within Terra which is described as a natural energy in the release of earth tremors is cross linked back to a sub aspect data set of [energy] within BushCo. This effect is replicated within Terra to Populace cross links as well as Terra to Markets cross links. Within all these crosses, we find that the Terra energy aspect is the point of origin for the links. This implies that the release of energy within the Terra entity will change the state of [energy] such as it is in all the other entities. One can interpret this to mean that the [energy] release within Terra is being seen as affecting all aspects of human habitat including our abstracted social infrastructure, inter-personal relations, and all things fiscal, including the recovery, distribution, and use of oil {energy}.

As previously noted, by the time we reach Part 4 we are 'racing time'. That is we are well within the time frame that was initially loaded into the model from the data obtained in the early processing. So while we do find that the modelspace is 'adding time' at the back end, and thus extending out into 2006 slightly, most of the data processed for Part 4 is referencing April and May.

Within the Terra entity we do note that the [energy] cross link to the Populace entity [energy] aspect which has a primary descriptor of [enormous][development]. Further, within the Populace entity there are descriptors indicating that the Populace will mentally connect the [weather/climate] changes of this coming summer to the seeming demarcation of the April 8th eclipse. This interpretation arises as we have Populace entity containing references to [midday][sun](obscured), as well as (surrounded) by [darkness] at [noon]. We also note repeated attribute descriptors for the (movement) of (sun) and (moon). The connection would seem to be obvious.

The data set for [weather] within Terra also shows descriptors for sun and moon activity suggestive of the coming eclipse, though there are no clear cross links to any specific developments to these descriptors. We do note though that the Terra entity has repeated references to the [rainwater] and [standstill] of earlier parts of this report, and has reinforced the image of [trucks] (waiting) in (mud) for (abundant/excessive/large) [rain clouds] to (depart). And, this section is cross linked back to the Populace entity and the issues of 'food restrictions'. Again, this data within the Terra entity is not a re-read of previous aspect/attribute sets, but rather new layers of data apparently also going to the same image. And we also need to note yet another primacy state change within a data group as this sub set, when progressed through the modelspace, moves from a state of 105 down to 5 in emotive primacy. This is indicative of very long lasting changes arising from developments within the climate. There are also repeated, in fact, dominant, references to the USofA geographically for this 'restricted food' due to weather. Within the data set we see the most geographic pointers indicating 'flooding' of some seriousness in rural areas where the 'ground is not yet thawed', and 'not yet ready for planting' which will become a sea of mud extending further than (half, one-half, less than total) of what [man] (walks) in a (year). Now to this last point, in 1900, the average human on the planet walked 1100 miles a year. This included the USofA population as well. Obviously this is no longer current. But our archetype processing approach frequently delivers measures of things in these forms. That is, we find that we can interpret '1/2 of man walks in year' to be between 200 and say 550 miles. However, for our needs here, it is usually interpreted as being a 'substantial' area, or large area rather than a specific size. What we seem to be getting here is that a very large, and seasonally unexpected, amount of rain will cause a very large area to go to mud which will affect transportation to a very large number of people, only we are not sure as to what 'very large' just might mean.

What we do know is that this data is specifically USofA focused, and that the sea of mud references are replete with agriculture lexical

connections indicative of rural areas. There are some small geographic references for the 'mid' part of the country, but these are also balanced out with 'mountains/hills to the west'.

The situation within the USofA focused data is more or less mirrored for the EU landmasses within the Terra entity. We also find that this summer bring climatic change that severely impacts human activity in the EU. We note that lightning storms and rain storms will have a very heavy impact on the [central][mountains] and will cause [water] (avalanches) to affect the Atlantic states {ed note: Holland, Belgium, France, Portugal, Spain}. There are many references within the 'water avalanches which go to the idea of [wearing/grinding] (smooth) the (land) to the (ocean). And we find that large groups of the population will be (isolated) by [floods] and [flooding](rivers) where none (before)[existed]. These isolated groups are seen as also encountering [restricted] [foodstuffs] and apparently will require [airlift](relief) for some time. This [airlift] will encounter extreme [difficulty](monetary) and is seen as being in [danger] of (failure) due to (impecuniousness/poverty). This period is seen as developing when (late) (summer) [weather] (arrives) with [clouds] (towering) from [mountains] to [space].

As an aspect, the 'towering clouds to space' have a number of interesting cross links. In one we end up at the April to May 28th date range which has so afflicted the Markets this period. But within the Terra entity we note a very poetic descriptor rising as we move the modelspace forward, that is, [white flowers]. We also note that these [white flowers] are associated with the Atlantic Ocean and the Eastern Seaboard States of the USofA. It would make sense, given the image of clouds towering to space to presume that at some point the media will present images of these storms as seen from space and that this is where we get our [white flowers] image.

Within [white flowers] attribute set, we find that the Eastern Seaboard will react to these storms with [evacuations]. This dominant attribute is

supported internally with references to sub aspects that include [hoarding], [travel], [packing], [boarding] (property) and other such lexical staples of what we call our 'usual suspects' for mass evacuations.

Recognizing that this is a very unusual time for the Eastern Seaboard to receive storms, we nonetheless note that the [white flowers] contain, 'spinning' and 'rotating' as primary attributes. And other indicators to reinforce the occasional reference to 'hurricane'. Also though, the images present within our data suggest that unlike previous years, that a number of these [white flowers] storms are seen as developing off the coast of Europe, specifically France, and then moving toward the East coast of the USofA. A most odd image indeed, and that is why it is presented. There is very little to suggest that these storms are merely early hurricanes which would develop off the coast of North Africa and then move west. Instead we get several sub aspect/attribute sets which reference European Atlantic coast and specifically, France.

Within the [white flowers] data we find cross links back internally to our Terra entity and its view of 'ten wind storms'. Perhaps this is indicative of some of these [white flowers] storms being all or part of the ten wind storms seen through spring and summer. There are also cross links within this data and Populace which go back to BushCo and Markets indicating that these storms will be happening as we proceed to the financial storms detailed below.

Markets - Dollar Roots Yanked, Day of Abandonment, Return to Well

New data within the Markets entity suggests that the global reliance on the USofA dollar is waning. We note that for the period of April through May {including our May 20th? event/change}, we find that the emotive values for the dollar resolve down to a new primary aspect of [uprooted] in which the primary descriptive attribute is [exterior]. We find that the (new)[man] will (bring) (like kind/similar) people to (discuss) the [situation], but that (hidden)[thoughts] [uproot] the (meeting), and cause the [roots] to be (yanked) from the dollar. We also note that a (three/3)

day crisis will emerge as a result of these (hidden)[thoughts] in which [communications] will (fail) requiring [personal] (emissaries) to be sent. These [emissaries] will (present)[face] of (hooded/lidded)[anger] to the [neighbors].

Further referencing the dollars' degradation we now have new aspect/attribute sets, also affective within the April/May period which go to the explicit statement of [no] [confidence] in [unlimited](possibilities) which as repeated attribute sets suggesting that the [unlimited](possibilities) mentioned can be interpreted as meaning the 'unlimited' nature of the USofA dollar. These aspect/attribute sets are predominantly EU referencing, with some small number of descriptors for Russia, and Asia.

Within the Markets new dollar [no] [confidence] data we have cross links going over to the Populace entity where they connect to [common people/plebes] (possess) (great) (capacities) to (subordinate). Then, references to [neighbors] are (already/previously)[prepared/ready/anticipatory], but are (subsumed/enveloped/covered) by (sea) of (angry)[arms]. We also find within the Markets entity direct references to [riots], and [chaos], and [hanging/execution] all tied to the (uprooting) of the [dollar]. Within the Markets entity we find that the [plebes] are (viewed/considered) (unreliable) in the [emergency/crisis] and viewed with [trepidation]. A minor cross link back to Populace shows that there will apparently be some level of awareness or discussion about the [elite] being (afraid/fearful) of (mingle/association) with [common][people].

If we burrow down through the data in the Markets entity which is USofA dollar related we note that we can go back through the data set and see the firming of the ALTA 105 references to 'dollar rejected by all'. Within our topmost layer of recent data we again find similar references. In this case the language goes to the effect that [universal](abandonment) and (no)(influence) [everywhere], as well as [general/universal](stimulation) of (creation) (ceases). There are several

hundreds of such aspect/attribute descriptors all indicative of a general, global abandonment of the USofA dollar.

We need to be aware that the Markets entity is undergoing a primacy state shift at many levels. These shifts are indicative of a very radical alteration of the Markets as an entity within peoples daily context. Seen occurring over the April through May period, we find that the [markets] will go from [fulfillment] to [conflict] or from [pinnacle] to [tension]. Further there are aspect/attribute sets which go directly to the images of (over estimated) [strength] (under cut/removed) (first) to the (knees) and then to the (toes). We also see that there are those who will (proceed/walk/progress) (alone) on the [road] (fully/completely/totally) (determined/of a mind) to (repel/chase away) [weakness], but that these will be (covered) in [mud] {ed note: archetype for failure} and (slaughtered/killed/put to death) by (servants).

Within the Markets entity are numbers of aspect/attribute descriptors indicating [failure] at (removing/excluding) [weakness] from the markets. Apparently some attempts will be made to (proffer)[reform] , but these will be [rejected] by the masses. The images from these descriptors are of repeated attempts to (crawl) (out from under/extricate) the [mud] but that each attempt will result in (falling) (back) into the (soggy)[marsh]. Also within these aspect sets we do see some ominous words suggesting that [blue] will attempt to (use) [force/weapons/conflict] to (suppress) the [riots] of the (presumed/viewed)[weak] which will arise around events within Markets. This suppression by force of the rioting weak {ed note: further amplified by [hunger]} is seen, through cross links, as resulting in [hurts/wounds] to the BushCo administration. In the data set the reaction to the suppression of the rioting weak is seen as causing (open)[fear] which causes (restrictions) to be (said/stated/read) to the Populace. This is seen as a very much (inciting) event in so far as the cross links back to the Populace. In turn this (stating) or (reading) to the Populace is viewed by them as (enticement) to (action), and (disrespectful) of the (relationships) involved. One obvious interpretation is that financial

events in upcoming weeks will cause a public demonstration of some form, or threats of one, which in turn causes statements to come from Officialdom which (warn) the populace not to (get) (out of control/out of hand) or there will be (repercussions). These statements themselves are seen as being the proximate cause of the actual actions/riots which follow.

At least one direct effect of public action is indicated within our descriptors where in the [markets] are seen as being (unable) to (continue) due to (cannot) (rely) on (workers) to (attend). Within this descriptive set we note that disruptions akin to something like a spontaneous national strike are seen as arising. The aspect which takes primacy within the Markets entity as we progress through the modelspace for April/May is [abandonment]. The attributes under this aspect indicate that markets will be abandoned at many levels. Some apparently just simply shut down due to infrastructure problems such as telecommunications failures. Others are seen as being abandoned by those who work there as they realize that the (game) has reached (fruition/completion). The images from this last are of (workers/laborers/employees) just simply (walking) out during the day, computers on, phones ringing, and a very large, depressed 'after hours' party starting in midday as the (truths) (solidify) in [perception].

We note through cross links to BushCo that during these weeks of [markets] in (agonizing) [tension] each (effort/work) attempted by BushCo to (resolve) the situation merely encounters yet more problems and the effect of (hitting) [walls] with (fists) (leads to/produces) [faces] which are [red] with [rage] and [frustration] in (public)(presence). Further as the financial crisis expands around the globe we note that BushCo will be (cast out), (isolated) and (cut off) from access to (centers) of [activity/action] as those impacted (fight) for their own survival. The BushCo entity has gained numbers of 'fingers' of attributes which suggest that many public failures to gain international cooperation will be very publically seen. The populace will not like the [collapse] of the (rigidity) of BushCo which is apparently to be seen in [tears] in a

public forum where [frustration] with (reality/events/circumstances) wells up, and is viewed with (revulsion).

Thereafter, things appear to go downhill rapidly with the Markets general tensions/problems escalating rapidly into the period of the roots getting yanked out from under the dollar. Perhaps this section should have been better named as the 'wholistic trip to hell' as what appears to be developing is the unraveling at a very fundamental level of years worth of artificial barriers and manipulations. This is not a good time for the planet.

Within this period, it does not appear that the Euro as a currency will be any form of safe haven. In fact, there are indications within the aspects/attribute sets, especially those on the 'far edge' of our time frame indicating that paper currencies of all kinds, no matter the issuer, will fall into [disrepute] such that [all] will be (reluctant) to [accept] (promises). There are also indications that the European Union as an organization will be severely stressed over the next months and into fall. These stresses will arise from (internal) [conflicts] at levels of both social, and fiscal organization. We also can see several lexical clues toward the European Union coming under severe stress internally as a result of the developing USofA markets problems. This seems to happen just as BushCo is demanding 'help' from the EU neighbors. And this is just at the time that the EU neighbors make a decision toward (deliberate) [rejections] tainted with (rancor) when dealing with BushCo and the USofA dollar. As we note in our cross links, at the model is progressed through this period, the EU is seen as encountering such fiscal difficulties that [rescue] efforts are affected.

As an interesting side note, the recent data processing also shows a period this summer when the USofA is facing such fiscal problems that [rain] based natural disasters within the continental US are affecting the ability of BushCo to mount a (relief) effort. And within this area are several aspects for the [army] whose attribute sets suggest that monetary issues will force BushCo to try to use the [army] to (battle) [rain]. We

also note that there will be some serious impacts politically which emerge after the mid- July time period. Within a period from July 14 through August 18th we find that BushCo will be (unable) to (communicate) (past) the (shouting). This period is seen within the Populace entity as a period in which BushCo is simply unable to get (their/ownership/possession) [words](heard) due to a (perception) of (revealed) (past) (lies).

Returning for a moment to the USofA dollar as a subset of the Markets et al entity, we note that beginning this week and through April the primacy of the aspect chain begins to shift. What we see as we progress forward is a curious effect that we shall call [return to well]. This is an odd phrase that developed as the only real way of conveying the image that comes through the attribute set. Within the data for the USofA dollar we find an aspect rising under the general [rejected by all] primary aspect. This rising aspect is really [return], but its attribute set is complete dominated by the image of people dumping buckets of water back into a well. Further within the cascading attribute set for the image we find that the [well] will (overflow), and through (policy) (cannot/is not allowed/forbidden) be (capped/lidded). Further this period, as noted, is linked to a date range which begins with April 4, 2005.

The whole of this structure is replete with imagery of a 'well' and its problems. Further, by direct connection through the [currency] aspect of the Markets entity, and by hundreds of internal cross links whose geographic references all go to the same link, we know that the [well] is associated with the USofA dollar. As our aspect chain has over 23 thousand references to financial structures including several primary ones for banks, and currency trading, and these are all dominated by the archtypical imagery at the top of the chain, a fair interpretation would be that the 'mystery' of the creation, use, flow and destruction of the dollar is being represented best as a [well] under the circumstances. Now, true, we could say that the effective substitution would be Fed Reserve Bank, but still, within the lexicon as it is constructed, the creation of a 'dollar' is mysterious. There is no clear representation of machinery, though in the

past we have had some data point to 'press' but we had to alter this to distinguish between the idea of a 'printing press which may be used for money' and the general 'press' or mainstream media. So, under the circumstances, we note that a [well] is being used as an allegorical representation of both the Federal Reserve Bank and the process by which it creates the USofA dollar currency.

Within this 'well' of dollars, a cross link over to the date area links to April 4 as a specific beginning point, but when progressed the [well] aspect travels through to at least the end of the time period being modeled, approximately the end of February, 2006. Over this period, and actually indicated to begin tomorrow, on April 4, we see that the [well] will be [visited] by people (carrying) [full buckets] which they will [return to the well]. The issue is that all of the returnee's are dominated within the descriptor sets as foreign to USofA, and the further issue is several of the secondary aspects which go to the idea of the [well] (overflowing) and the (waters) [rushing] (back) to (flood) the [house]. We see that the 'flood' will begin (quietly) with (fortunes)(walking)[silently/stealthily] toward the (contaminated)[well]. This [stagnant] [source] is seen as (filling) the [plaza] with [mud] so (sticky) as to [entangle] (all) in the (material). Then we see that 'buckets' are 'dumped', (each in turn/sequentially) in apparently controlled fashion as we find the phrase, 'as each is allowed/allocated'.

Our 'well' is going to receive at least several [scrubbings] over the course of the next few weeks, likely this is indicating there will be a serious effort on teevee to 'talk up the dollar'. This cleaning of the image is seen as an abject failure and contributes to the problems of both BushCo and the Markets. The images coming through the data set are very much of a period in which all actions are hastily conceived, and executed, resulting in even more problems and side issues arising with each action/reaction cycle.

NOTE: Our processing has a date range, beginning with April 4th and running through May 21st, associated with a subset of the Markets entity

in which a visual 'hydra' of problems appears. During this period we find a whole slew of secondary aspects which start to degrade in both emotive sums and durational values. What we have is a period where apparently the whole financial structure globally is going to spring a bunch of small leaks. These leaks grow in size and pressure, each acting upon the other through unexpected side issues and reinforcing the growth patterns of the multi-headed problem hydra as a whole. Within the April 4th week we can expect to see several areas develop their 'leaks'. These include, among others, [derivatives], [fiduciary responsibility], [dollar], [interest rates], [commodities], and once again our friend [energy]. Some time in the May 15 to 28th time frame, as indicated by our progressed modelspace, one or more of these hydra-heads will rise to dominate and, with the response to it from 'officialdom', will cause a huge heap of change. Note that our emotive value set for the level of change involved is significantly larger than either our Sept. 11th values, or the recent Sumatra tsunami event. The initial spike is not as large, but the carry values within our May 20th event continue to grow as the model is progressed over time. Within this progression we see that by May 20th the areas of problems contributing to our hydra of issues include [trade] (global), as well as [shipping] both internal USofA and international, and [currency]. This latter implies that the initial problems afflicting the dollar are spread to other paper currencies and debt instruments.

Also cross linked from [debt], we find repeated links between this area and those referring to [food restrictions] within both Populace and Terra entities. It could be that fuel becomes so prohibitively expensive that it impacts the delivery of food internationally. There are several cross links back to energy which would suggest this, but the dominant components here are clearly both fiscal and paper/debt contracts. So perhaps a better interpretation is that global food commodities or other affecting markets are [roiled] and [inextricably] (stuck) in (sticky) [mud] and that this impacts future food deliveries internationally.

We also see that within this immediate period of April, and in spite of the numerous 'scrubbings', that a very public rejection of the dollar will take place. This may be referring to USofA Treasury or other auctions, however, the net result will reach the mainstream media where it will be seen as a 'no willingness' to (embrace) the [city] {ed note: in this context, 'city' is indicative of the financial industry where debt instruments are created}. As this rejection is hitting the media, so will reactions such as within [interest rates], and the [bonds] market. We also see direct cross links over to BushCo with internally reinforcing cross links suggesting that, again, every attempt made by BushCo to 'scrub the dollar' is met with (disbelief) and (derision). And then the problems grow. Ought to be an interesting week leading through a very interesting month.

One of the terminating attribute sets wherein those who own the well are seen as 'not being able to reach deep enough to stop the leaks'. A meeting with the powerful will be called, and within this context a 'face of fear' will be (viewed) with (alarm) {ed note: a terminating cross link back to Populace}. Now the temptation to see the [well] as relating to [oil] as in oil wells is understandable, but due to the nature of our lexical processing, we can be sure that this [well] is a metaphor for the USofA dollar and the Federal Reserve Bank.

We do note that [oil] is interlinked within the structures for the [well] of dollars. And within the subset for [oil] we also see a clear link to the date range above, that is, beginning April 4 and moving forward through to May 20th or so. Within the [oil] subset we find that the dominant aspect is [coagulation]. Further as the modelspace is advanced, the coagulation descriptor takes on considerable reinforcing values. The interpretation from the attribute sets is that [oil] as an industry will be 'coagulating' over this period. The suggestion is for less material to be available, less to be shipped, and higher prices all around. Further, there are clear cross links back to the Terra entity which go to the idea of 'separation' of 'layers' which are involved with the Summertime Shakes. One possible interpretation here is that the quakes of summer will

damage oil production or transportation facilities. There are several minor threads indicating that the Iraq oil reserves will be far less than reliable, and with other facilities being put under pressure or 'separation', we find that the [oil] entity gains huge numbers of various kinds of cross links as we move through summer towards fall. Within the [oil] subset of the entity, again, cross links back to April 4 to May 28th. However, within this subset the rising aspect is [extreme caution]. A dominant attribute within this rising aspect is [words/logos/speech]. Further attributes suggest that 'loose lips' are about to really cause some problems for some 'financial ships'. It would seem that [oil] as indicated through cross links back to Populace is also 'rising' as a subject matter to the general public, but that the current rate of rise to consciousness is nothing when compared to the advancement seen within our modelspace over summer. There are many lexical clues within this aspect which suggest that we will quite actually see the words OIL SHOCK, within mainstream media within the month of April.

We also find that cross links back to the BushCo entity indicate that officialdom isn't going to handle this period well. We see indicators that suggest that Bush will be so shocked by something (spoken)(softly) to the (ear) that he will (rise up/jump) and (soil) [himself/personal]. Now note that the lexicon is not necessarily indicating that Bush will 'pee his pants' as this language could also mean that something is spilled on him. In fact the lexical construct is as follows for this emotive archetype: soiled/spoiled/disgraced/dirtied/slandered/perjury/lying/unclean/contaminated.....and onward for several hundreds of like meaning. We choose soiled in this case as a general expression, not a specific descriptor. However, what is worthy of note is that we are getting many cross links indicating that 'shock' and 'shocked into stupefaction' are to be the first response from BushCo to the developing Markets problems. Thereafter, once they regain their few wits, they apparently start (acting) (before/prior) to (knowing/understanding) and instantly things are [worse/degraded].

The internal cross links within BushCo suggest that the April 'shocks' are also going to shake loose a little more than mere incompetent speech from officialdom. There are some lexical clues suggesting that beyond merely standing on their tongues and then stuffing their feet in their mouths in their haste to act, that some how officials of BushCo will be seen in the media as (walking) [backward] (while/during/continuance) their (excuses/lies) (evaporate) (revealing) their [faces](blushing) in (shame). This may be more suggestive of 'back pedaling' on some hastily spoken words than actually walking backward.

### Antarctica - Inner Fire Redux

In conclusion of Part 4, we revisit the Antarctica- Inner Fire structure as it has gained substantially during this processing. We note that it now contains a populated aspect set which goes to the idea of 'rotten interior of the enormous house crumbles' and further that the 'crumbling' triggers the 'exposure of the facade' and its 'delicacy/fragility'. Not good. Further we find that the 'enormous house' having its rotten interior crumble is seen as having the crumbling connected to our 'plate shift' seen earlier. There are repeated indications that an earthquake will start the process off. We see that the 'inner fire' will be 'rejected' {ed note: within BushCo as a proxy for officialdom} but that (denial) is met with (absolute) (disbelief). Due to cross links, this inner fire in Antarctica may meet the context of the 'continuous release of energy' which is seen as a result of the Summertime Shakes elsewhere within Terra entity. There are also a small number of attributes which go directly to the day of 'season change' as the timing for this, however, these are balanced by a larger number which go to the idea of the week of April 4 through April 9. As there is a an eclipse of the sun on April 8th, this is not out of the range of possibility.

### Conclusion - Notes

We do find that our UFO references are still scaling up as we move the modelspace forward through time. It is anybody's guess as to the meaning of this datum.

Part 5 will include the last of the processing of the remaining data reads, and its interpretation will focus on the smaller, as yet un-examined entities and sub sets as well as reporting any new developments. We do not anticipate a part 6, and will hit our bandwidth goals with a 55+ million read run this time. Part 5 is anticipated to be posted by Monday, April 11, 2005. If anything interesting pops up within the data being processed we will issue an update by email.

Data set distilled from 55.138 million reads.

## Note on Hyperspatial Angular Momentum

During the period of April 19th through April 23rd, the earth will enter an area of increased angular momentum when calculated using hyperspatial maths. The peak of the period is April 20th, with the actual peak pull being at 4:43 am Pacific Daylight Time, and with the peak of the pull being directed at the earth from approximately 119 degrees West over to approximately 154 degrees West longitude. While the momentum of force is mostly southern hemisphere affective, there will be some level of tangential pull north of the equator. The tangential effect would seem to extend as far north as say 40 degrees latitude. With these angular momentum increases, frequently come earthquakes. Since the point of maximum pull on the earth will extend from Antarctica up to Northern California, and from the Sierra Nevada range over almost to Hawaii, if we were to have earthquakes as a result of the pull it would seem this region, and its antipode, would be the most likely areas affected. The antipode of the area is from Iran over to about the Nile river and down as far as Madagascar, essentially the Mauritius Trench would be the eastern most boundary with the Nile being the western most.

## Oil - Lust Increases

Usually within our processing of the data at this point we are following the smaller groups of lexical 'clumps' which either are focused on 'small' entities or are entity ambiguous. It is from this last group that we gain our accretion values which move the entities through our modelspace. In our experience of several years using the same methods and code, we get to this point and have perhaps 5% in new values being added to our previously discussed entities. In adding these values, there is usually no real reason to alter the interpretation already posted as the 5% may augment, or alter slightly but cannot, due to its range of size and emotive sum totals, usually be expected to radically change the interpretation.

Within this part 5 processing we note that so far our usual and expected accretion values are behaving normally, even though the size of the ambiguous set has reached a very large 14.24 per cent of the overall emotive sum base. We also note that while small entities certainly exist, our total emotive summation spread values are becoming concentrated within a smaller range of entities. This is not unexpected as there are so many 'big picture' items out there to occupy attention, everything from papal succession to cataclysmic climate alteration, that the total amount of emotional energy expressed gets re-allocated to fewer items. Basically a way of saying that as large issues rise, humans have a tendency to 'stop worrying about the small stuff'. Our priorities change.

We have a very clear indication of that shaping up within this last of the 405 data set being processed. We note huge numbers of cross links between the Populace and between the sub set of the Markets entity which represents Oil as a concept. Where earlier interpretations have 'energy bending' the markets, we now find that [energy] (lust) (increases) (will/have) (change/alter/modify) the [populace]. We see that this (alteration) will show change within the Populace entity between May 20th and June 21. There are indications that this change will emerge over the summer. We note the marker references to the solstice, and that repetitious appearance within the Populace entity and within these cross links which go to the aspect of [lust] (increase) of references to [summer] and (into)[fall]. Within the aspect we find that the [lust](increase) will go to the national level, and that a [missed step/mistake] will occur in which our previously note 'massed armies' and 'tension' will (go awry). Apparently the outcome will not be horribly bad, and that the 'mistake' nature of the situation will be recognized, even by the participants, so a 'no foul, even though harm' attitude will be taken. As the situations develop around the building tensions over global oil throughout the summer, we note that our entities, in whole, when progressed through the period of summer/fall, end up with the Oil sub set not only 'bending' the Markets entity, but as we now see developing, the Oil sub set will come to totally dominate the whole financial entity

structure. Further we also note that cross links at a never-before-seen level are emerging between Oil and the Populace entity.

Within the self-altering Markets entity, we find that as the Oil sub set of aspects rise to dominance with their emotional sums that the primary aspect/attribute set for this change is [caution] modified by (shift/change/alteration/movement) in (social)(conventions). Further the implication from the attribute set is that a (totally/completely) [unfamiliar/new/evolving] social order is emerging. This view is completely supported by the Populace entity as shall be seen below. For the moment, sticking with our Markets entity, we note that the movement is from our current state of (setting off/launching) of [movement] with (hesitant/reluctant)[feet] and towards a flat out (lustful)[increase] as we move into summer. There are repeated warnings of various impacts on our Markets, and indeed on everyone globally.

We find that the aspects/attribute sets are replete with such references as [lust](moves)(armies) to (no)[good](measure/metric). Further that [military] (action) (fails) as (fuel) [dies]. That [movement] of [massed/massing/en masse/aggregated large] (nations) of (refugees) will (soak/inhale) the [energy] of the (armies), thus (defeating) them.

We find that as the Markets respond to the Oil movement to prominence over the course of this summer, we note that there is a bespoke aspect/attribute set which clearly states 'winds of change blow and distill out the essence' . We see that the [innocence] is (lost) for the Markets over the summer, and that (attitudes)[hardened] and that [hard] (faces) are (revealed) to the world as the Oil lust rises. We can see that the Markets will respond with (disasters)(striking) the [innocent] (person). Further the attributes suggest that [resource] (snatching) will, as seen through cross links into Populace, rise to the point of 'dominating headlines' on a daily basis. And that [thieves/brigands/pirates] will be the talk of the day. Again, through cross links to Populace, we note that the 'average person' will be 'brought to grief' completely 'undeserved'.

Curiously, within the Markets entity, it is the global 'viewing' of the 'rape of the helpless' {Ed Note: economically focused, not actual rape, just the emotive sum settles out to 'rape' as the best word for the emotional value of the situation} which sets off, or marks the 'point' of change for the morphing of both the Markets entity and the Populace entity.

Within the Markets entity we find that after the 'viewing of the misfortune of the innocent', the Markets are at that point beginning a metamorphosis toward (distillation) of [value] from (wasted effort/waste/useless). The entities, correctly or not, would seem to be signaling a definitive point of demarcation for social and financial change will emerge this summer. Further, as is expected, it is Oil focused. Further, as is indicated within our modifying data from this week's processing, the rate of change will accelerate this summer. Further, the emotive sums we have seen develop and shift within our entities this year are more significant than either the 2001 values prior to the 9/11 attacks, or last years' pre-tsunami 'bad waters' numbers. In other words, the data suggests strongly that emotional changes to occur this year will be of a nature that, later this year, we should be able to say 'after this day, the world changed, never to be the same again'.

Within the Markets entity, and following our change point, we note that the 'mud is cooked out' of our [ore], and the 'slag is eaten by the fire'. We also see that no section of life-as-we-know-it is unaffected by the emotive change. This suggests that as emotions move, so will markets. At least up to the point that the 'distillation' begins.

Our Markets entity, when viewed in modelspace in isolation, shows that within its own structure, we are going to 'distill' down to a 'human life required' focus. And that once begun, the distillation process is apparently going to be fairly rapid. We note that the cross links abound, and that as expected, huge 'waves of change' will wash over all aspects of life as we move through the last of spring and into summer. It would appear that we can expect whole industries to just disappear. And the

indication is that much of the 'wounding' will occur with speed that the change will have already past by the time the 'tear forms'. We note that unemployment is seen as a temporarily rapidly rising aspect within the Markets entity up to about September/October timeframe. The modelspace suggests that at that point the idea of the unemployment is moot as so many are without work. Not a good sign. Even if we set aside the interpretation of the [unemployment] aspect, we do note that over the progression of the modelspace through summer and into fall, the aspect undergoes a primacy state change from 49 down to 8. This shift is accompanied by a very large increase of 145.6% in the emotive total values for 'breadth' of impact, a 229% increase in 'durational of impact' values, and a 635% increase in 'depth of impact leading to behavior alteration'. The suggestion from the data change rate is that unemployment will increase and further that at some point, due to circumstances related to oil, the rate of increase will go exponential as segments of the social order collapse under energy/resources availability stresses.

We note that the emergence of a change metric for social relationships comes with specific market lexical clues to the future of the USofA dollar. We find that this summer will see the [maturation] of the dollar as it moves from 'flowering' to 'confusion'.

To the more immediate, we note that recent data additions in our processing indicates that the next period of a week to two weeks will see the acceleration of the trends towards our loss of market innocence. We note that recent data suggests that over this next week a period of complacency will shift very suddenly to a period in which the [blood] (pounds) in the [ears] and the [fiery] (blood) (pulses) with the (racing)(heart). We see a distinct 'trigger' for this shift is clearly seen as happening co-incident with the [disaster] (striking) the (innocent)(person/party/group). The disaster is immediately followed by (reports) of [theft] and [accusations] (against) the [neighbors]. This then triggers a period of [misery] for the (unjustly) (accused), but perhaps more importantly, the very act of (investigation) reveals (disease) of the

[timbers]. We see that the investigation reveals that [packages/parcels] have been (long) [hidden] in (empty)[dark] (halls), and that these parcels will bring serious [misery] and [grief] to the [owners], more [reflected] (misery) to the [neighbors], and [relish] in the (baser) [emotions] of the Populace as they are (beguiled) by the [developments] of the [investigation]. Co-incident with this, we see that during this period, as indicated under the [disease] aspect, and within the primary attribute of (disease) that an actual [personality] will be (struck) with disease, which is seen as (healing), but what is apparently pertinent, is that this [person] will (reveal) by their (absence) a [hole] in the (lies). It is as though this person, while not necessarily connected to the (lies) has somehow acted as a block to the 'seeing/viewing/perceiving' of the (lies) which (support) the [disaster] (striking) the innocent.

We also see that the data is indicating that a period of relative market quiescence is coming to an end. We note that 'wavelets' are building to levels 'beyond pleasant'. Within a series of cross links we see that the developing situation in Iraq is one of the wavelets now building energy. The moves toward removal of BushCo from Iraq will continue and will precipitate a crisis over the late spring and into summer as a [woman], (blind) in [one/1] (eye) is seen (rising) to [prominence]. This woman is a [widow] and gains stature from her deceased husband, but is also seen as [giving/providing/instilling](motion) in others in her own right. The references within the Iraq centered data are for a period of [strength] (testing) over spring and summer as a political movement (walks) its way to [power] independently of the more formal structure of the (imposed) [rulers] of the country. This movement will coincide with a [postponement] of (all) (rituals) during the [waxing][moon]. Our data would indicate that over the course of late spring and into summer a great shifting of actual power, not merely perceived military force will take place. That during this period a [cohesion] will emerge on its own, that Iraq will (press) back against the (weakened)[spine] of BushCo, and that [no](flow) of [oil] will occur during this time. Further, it is seen as being a period in which the [empty](words) and (hollow)(hands) are seen as (useless) in [returning] the (life flow). At this point, the emotive

sums we have in the BushCo entity, and the Populace entity both show that Bush has lost his Iraq war. As we progress both entities through the modelspace this summer and into fall, significant 'face' re-positioning takes place. We note that Iraq lexical elements are less and less 'encumbered' by BushCo cross links from late summer onward. We also note that oil shocks and crises from around the planet will take the focus off of Iraq as a central resource provider, but that this very spreading of the oil related problems will raise the 'stink' of failure within the Populace entity whose cross links go to BushCo and end at aspects of [rancor], [revulsion] and other, similar bespoke emotional responses. Within the Populace entity we note that most of these pejorative cross links are hanging under the [betrayed] aspect. Not a good sign.

Further we note that Markets entity has significant cross links going over to BushCo wherein we find that a Markets related scandal will (adhere) [reports] of (theft) to a political personage or group from Texas. While not a remarkable set of circumstances in the ordinary course of events, this 'sticky money' scandal is seen as [digging] into the [toes] of BushCo like a disease. The lexical cross links from Markets over to BushCo are unique in that they all carry Texas as an attribute, all contain references to money, and all are clearly indicating the exposure of a long covered scandal. Then there are further lexical clues suggesting that the 'sticky' money scandal will arise from the problems besetting AIG, will be seen to involve a whole group of very prominent politicians as fronts for the problems, and will lead to impacts on the markets. Within this area we find the very curious attribute set suggesting that some 'money' will 'disappear' as a result of 'exposure to sunlight' and that this disappearing act will involve huge sums. There are several, more than obvious descriptors indicative of derivatives as the source of these 'disappearing monies'. Due to the other descriptors, and the behavior of the Markets entity and its cross links within modelspace, the interpretation goes to the idea of a housing related impact from these derivatives which in turn participates at a huge level in the shift of the Populace discussed elsewhere in this report.

Populace - Cutting the Knot, Hardening of the Attitudes, Terrorism - Superficial Display, Space Shuttle - Elevated Lies, Israel - Slide into Mud, Papal succession - Improper Display

With the Populace entity moving through the modelspace in a very odd manner of large shifts rather than progressive small steps, we can presume to interpret the meta-level of the emotional tone of this period as being one of 'thrashing'. We find disparate, and opposed views struggling for dominance within the Populace entity. Specifically we can also note a large number of 'pulls' from outside entities for 'directional control' of the Populace emotional response. We find very large ropes of knotted cross links between Populace and the Oil sub set of Markets. Further we have more, albeit smaller, ropes of cross link knots between Populace and Terra. And lastly a very large number of cross links from Populace to and from BushCo; again even in this entity, dominated by Oil/energy as an aspect.

As we progress the whole of modelspace through the spring and into about mid summer {repeated references to date range of June 8 through July 17th}, we note that the Populace entity nearly doubles its cross links to major entities while losing over 70% of the cross links to minor entities or sub sets. This indicates that our shifts will be very much large picture events, and as we observe as the modelspace is moved forward, the focus continues to narrow as we move forward through the year. The very clear indications are that the modern 'age of individual distractions' is about to end. Also, apparently the end will come very rapidly. We will then begin a shift into what the Populace entity would characterize as the 'age of common concerns' or perhaps the 'age of common afflictions', as both are supported within the aspect/attribute sets.

One aspect/attribute set rises during the period of May 20th through to June 8th and can be termed 'cutting the knot'. The attribute set further defines this with (relationship) to (vital)[energy]. The [energy] aspect

cross links back to Markets, and Terra. We also find that the Populace will come to view the Markets as (everything)(flows)[downhill], and that (no)[barriers] (lay/are/exist) [downhill]. We also find disturbing rising of many and various ways of representing the idea of 'violence'. This is violence both as random kind of acts as well as the more organized violence of war, and most curious of all, repeated aspects/attributes going to 'mob violence'. Further the geographic descriptors attached suggest that the mob violence will take place in North America.

Other, perhaps more expected, aspects indicate that the Populace will view themselves as [bearers] (robbed) on their (journey). Of course the obvious interpretation is that we will feel even more 'robbed at the pump' than we do now. While not at all unexpected, what is a surprise development, is that this feeling will apparently abate or be supplanted some time later in the year. It is as though some other of our 'common concerns' rises to dominance, knocking down our general tone of grumpiness about energy. However, noting the various references to [rusting] and [lack of](movement), and other such indicators, it will not be a sudden availability of oil that reduces the emotional component here. Rather, as the data indicates, we get used to 'walking amidst the rust', and using 'legs to relocate'.

A serious note of caution is that the Populace entity has a very fully populated aspect set which is headed by [mighty/powerful] and [violence] each with equal emotive values. However, we need to point out that the predominance of descriptors are cross linked back to Terra where they resolve to [rain] within the [weather] aspect. We do see some cross linked aspects which are related to human violence, but in the main that does not appear to be the primary reason that the Populace will perceive the period as violent. In this case, the preponderance of data suggests a Terra based violence amidst the more or less normal levels of human2human violence. The central aspect of 'mighty violence' is repeatedly confirmed within the Terra entity as well.

Within the Terra entity we also see confirmation of the idea that geoevents will affect the Oil supply, again, such that (rapidly/quickly/suddenly)[walking] (legs) (become) (common). And further it is seen that [cooperative][walking] will arise as a minor aspect within media coverage. Along with the numerous references to [walking] we also find that almost all the attribute sets provide imagery of 'walking amidst/between rusting relics'. A very affecting image to arise within the data in such a very short time. When tallied, we find zero references to 'rusting' within Populace up to October of last 2004. Thereafter we see that the idea of 'rusting hulks' and 'rusting carts' starts to emerge as a very minor rising descriptor within a few of the attribute sets. Within our Part 5 processing we find hundreds of processed references to rusting as an aspect or supporting attribute. Primarily we are finding these references within the Populace entity, and some small amount appearing in the Markets entity. This latter is more or less normal as we do get descriptors occasionally which go to 'rust belt industries' and such. However, this is a new appearance within the Populace entity and it is now very firmly established as well as rising in importance. The aspect is reinforced with all of the expected colors, and other sensory descriptors, and all are within the Populace entity. We can also note that the imagery is pretty consistent in all the sub attribute sets of 'rusting' as in (entropy) (just now/this moment) (engaged); that is, rusting as an active process.

In returning for a moment to the primary aspect of the Populace entity as 'cutting the knot', we find that the knot being cut is not with [energy], though in a sense, energy is about to cut its relationship with humans, but rather the idea or image we are presented is one of the populace cutting the knot with its relationship with its own illusions. This idea is supported with repeated references to [hard][awakening], and (slapped) into (consciousness). There are several complete aspects/attribute sets which go to this idea of a 'hit on the side of the head' causing a sudden burst of awareness. Or as the data itself would have it, (brought) to [reality/facts] (in spite of/disregarding) [others] (priorities). We find within the supporting attributes that the Populace will lose its innocence

along with the Markets this summer and becomes aware of (masters) of [destiny/fate] who (willingly) or (casually) (initiate/cause/create) [harm] to the (undeserving). Further the prognosis for this awareness is seen as causing some serious changes in the social order at an inter personal level. We see that a part of the Populace entity suggests a gruesome 'game' emerges speculating about (who/person/personality) (still/yet) [remains] (alive/living).

We also note that within the period of the rise of 'cutting the knot' as our primary emotive image for Populace, and as the Populace entity is advanced through spring and into summer, that our [rebellion], and [resistance] aspects both grow significantly in supporting attributes. It would appear, at first glance, that the 'rebellion' aspects seen within the BushCo aspect of [press] were being reinforced within the Populace entity. On further examination we find that this is not so. In this case we are seeing 'rebellion' rise, but really only as a minor expression to the 'resistance' values. Within the aspects we see that the 'resistance' will arise on a personal, local, and national level. On the levels, we are dealing with 'resistance to sudden change'. Perhaps, what is really being indicated is a period of several months for us all to 'get used to' the idea of the sudden change with our relationship to cheap energy. During this period an expected portion of the population would be in denial, with the expected emotive pressure as things 'dawn on them'. This would perhaps explain the resistance element that we see arising here.

We also do note that the 'cutting of the knot' includes several cross linked aspect/attribute clusters going to the idea of the loss of innocence of our relationship with government. We do find our 'rebellion' aspects within this cluster and cross linked both internally and externally to the idea of a [personal/private/individual] rebellion, perhaps more against circumstance than persons. And it would seem there will be plenty against which to rebel.

This rebellion is seen as well integrated into a general hardening of the attitudes. We note within the Populace entity suggestions that a general

population will move toward a significant [hardening/setting] of the [attitude] into a period of armed tension, perhaps civil war. The data is geographically ambiguous. Well, actually confused. We do note enough references to suggest that perhaps the situation in Iraq or the middle east in general will take a very abrupt turn this summer, leading to actual physical 'jostling' of peoples as 'powers align'. We can see the modelspace suggesting that (inherited) [grievances] will drive our [repositioning] of large amounts of people and resources. This period is suggested to last a couple of months perhaps, followed by a period of (rigid) [tension] immediately thereafter. The suggestions are that the (rigidity) will spread to other [borders] the way the (walls) of a (cell) (harden) (all) (around) once [disturbed] at (any) [point]. We also see that [youth] (behaving) (compulsively) will bring a (dangerous) [turning] [point]. It is curious that we actually are getting numerous references to bespoke [turning point] both as an active accretion value within attribute sets within the Populace entity, (turning)(point). We also find the same expression as a rising aspect within several subset area of the Populace entity.

With the visual 'tipping points' appearing in several entities within this run, and now the Populace entity containing references to the same concept directly, the interpretation has to go to the idea that the populace of the USofA and the planet is in for another big shift this summer. The level of values that we have now are at or exceed the same level of values that we had last year prior to the Sumatra tsunami. Then the values were going to the idea of a mass consciousness change as a result of weather. Here we have the same level of values emerging which are scattered among several subjects including economic, and social, and now geo-political. What we are seeing around this bespoke [turning point] aspect is ambiguous as to place. In fact we find as many references to USofA and Mexico as we do to Iraq. We do find that the 'compulsive behavior of following the inherited anger' will apparently 'burn out' quickly in 'one burst' and then 'depletion of energy/resources'. This latter is tied via cross link to the issue of USofA (hurricanes/storms) this summer as is discussed below.

We also have a very large number of indicators suggesting that this summer will bring 'tensions' between the USofA and various parties in South America. It would appear that such tensions will escalate out into the open, and that a regional 'not-so-cold' war will develop within our hardening of the attitudes. This will cause great confusion within both the USofA government and the various states in both central and south america. The aspects/attributes here suggest that 'virtually overnight', wholesale changes will occur both politically, as well as economically. These will lead to very rapid (military) response, though not in the sense of fighting so much as a 'rush to readiness'. Within this thread we note that within the USofA descriptor set are a large number of cross links going back to BushCo indicating much consternation with these developments, leading to instant (incompetence), (confusion), and (stuttering)(reply).

The hardening of the attitudes shown within our data also points out that (cancel) will become the word of the day in so far as 'free trade' agreements are concerned. It is shown that the 'free trade' concept will be (infected) and (badly)(diseased) by events within our hardening of the attitudes. This 'infection' is seen as spreading out to all the 'free trade' agreements and will also touch both the world bank, and the IMF.

The cross links back to BushCo show that this period of shifting to 'active tension' with South America is also co-incident with the [currency] problems which will progress like a [vein] to the (heart) of the change seen within the USofA population. The hardening of the attitudes is also being seen in an echo emotional component within the USofA based descriptor set. In this case it appears to be a developing 'hard attitude' with the lack of effective government action in a great many areas as though the populace in general will get [steamed/irritated/angry] with the [dancing] around seen coming from government during this period of deep and broad social change.

Within the modelspace, our lexical pointers to the concept of 'terrorism' have some minor level of activity. Within these the primary aspect is one of [superficial](display) with a modifier of primary attribute of (has/does) (little/small)(success). The rest of our indicators are suggestive that there will be some level of 'terrorism froth' with little substance over the course of the summer. We note that the general idea of [disguise] is floating upward in primacy, while carrying a large attribute set going to the idea of 'down playing' or as in the set 'disguise oneself in a sack'. And that 'disguise is required' to 'leave the carriage' and 'continue on foot'. We also note that 'beards are (unstuck)', revealing 'men in white'. We also note a large area of language around the idea of 'duplicitous movements' and 'subterfuge' wherein the persons involved 'works in magic in shadows, but in front of crowds, denounce evil issues.

As our lexical set relating to the subject is small, we find little in the way of descriptors. This could be that any such event is either way out in the future and more data could be expected to develop as we progress through the year, or that any such event is very unlikely. We do note that the descriptors say that the 'rock shrugs off the heat of the fire' and that 'shale sings smelly to blacken but remains'. Further we find that 'purple/lavender/pink crystals seep in water, diffusing affect'. This latter is suggestive of a 'screw-up' and indeed, there are lexical clues supporting that idea in that we have our primary attribute set saying 'has little success'.

Those other descriptors we have suggest very early morning, pre-dawn in that we have references to 'dew point' and 'dew appearing', as well as 'dew collecting on low leaves'. Also we note that the site chosen contains a land mass with (three/3) [chins], and that each [chin] is taller than a [man] on a [horse]. We also note that the aspects/attributes suggest 'three lines of flying', and 'flying over three lines', as well as 'economical' as a 'roll of silk', and 'lightweight as a roll of silk'.

One might be tempted to use the silk references to infer a 'silkworm' missile, and juxtaposed against the flying references, this may suggest a surface to air missile attack on a plane as the next 'terrorist' episode. If this were to be accurate, then one could also suppose that the result will be 'wet powder' and a general 'fizzle' leading to incarceration when the 'beard falls off'.

However, with such a small data set, the above is mostly really-reaching-for-it conjecture.

We also note that within the Populace entity is a subset of aspects/attributes which suggest that one of the next big emotional 'movers' for the populace at large will be the idea of [restricted movement]. Now while we note that this is repeatedly showing up within the Terra entity in conjunction to 'food supplies', we also have to note the multi-dimensionality to the nature of this subset. It would appear to be indicating that a 'theme' is developing which will emerge over the summer. While less than explicit, the geographic references would suggest that this theme plays out more for North Americans than others, though there are indications of global impacts. The 'restricted movement' theme is emerging at multiple layers with multiple subjects being suggested. It would appear that not only weather will cause 'restricted movement', but that other factors such as perhaps government edits will also participate in the general theme. This 'restricted movement' period is seen as beginning this summer and stretching through to the end of the year if not beyond. While there are no indications of a general restriction, and rather merely lots of local restrictions all due to a variety of causes, we do note that the impact will be so general as to permeate the consciousness of the populace and is seen as arising in mainstream media. Within the more narrow focus of this specific data set, there are further descriptors which go to the idea of a 'fiat' imposed [period/span] of [restricted] (movement), which is then [lifted] as (redemption) of the [circumstances/set/setting/array] are (corrected). Hanging off of this set, mostly fully populated is another aspect set which shows that a [dichotomy/duality/opposition] of view

point about the [incident] will form in which [government], that is, the upper echelon who imposed the movement ban, will perceive of this as just [regular/ordinary] business, and totally miss the profound change that develops from the Populace perception of the 'in situ' imposition. Our indicators are that the impact carries forward for the Populace into next year, but that the incident arises on or before the Fall equinox.

The Populace entity also contains a data set area that in the past we used to translate as [marine] based, that is, pertaining to the human exploitation of things oceanic. Within this area, we also saw the [marine] (accident) of some time back that really was an interpretation of the space shuttle Columbia {'gem of the ocean'} disaster. We have since modified our data collection to separate those areas relating to human exploitation of space, from those of terrestrial nature. Using this new feature, we note that the [space shuttle] will have some difficulties. It is seen as being in a [dangerous](ravine) in which what is [sought/desired/goal] will not be found. The data further suggests that after a 'formal dinner/celebration' at which much 'feasting' occurs with many 'proclamations', we arrive at a place where problems are as thick as [thorns] in a (hedge), each [penetrating] (skin) and, curiously, once again [restricting] (movement). Also within this area are several subsets off of both 'thorns' and 'hedge' indicating one massive big problem. This problem [hedge] is seen as so big as to (ensnare) the [elephant/large beast]. In fact we have repeated references to (ravines) [trap](bison) in [great] (numbers) and other indicators of a not so smooth launch period for the space shuttle. What is really odd is this fully populated data set which comes off the 'problems' areas, is completely cross linked, and goes to the idea of [lies] (elevated) [now seen/viewed/discovered/located/found/exposed]. Further, the [lies] aspect has cross links which go to the idea of (shock) of [discovery/exposure] of (core) of [lies] (leads to/induces) [quavers/small shakes/tremors] in (social)[cloth/fabric] such that (those/persons) (exposed) as (believing) their (own)[lies] are now (mind)[bound] to their [lies] as (truth) as are [birds](ensnared) in [thorns]. This is seen as [causing] the (loss) of (all) [upward/skyward] (movement). Further we

note that the rancor seen within the problem set apparently will cause some rather 'shocking' public behavior on the part of persons of position who really should know better. We find that [piss] (never) [runs/flows] (uphill), and that cross connected off the [piss] aspect, we find that that (superiors) will be (induced/compelled) to [piss] their [clothing] by (indiscrete) [words]. Not a pretty picture. The only note from this episode which may be considered to be good is that we do not show any signs within our data of another accident. Rather what we see here is a developing complexity of problems at which is a core of lies. These problems will be seen as the cause of much public rancor, but are not seen as actually preventing the lift-off. There are some indications for a shuttle lift off, in spite of the problems, and within our modelspace the Populace entity does show the [space shuttle] connected data as moving forward. We do need to note though that within the modelspace we get to a place in early summer where the [space shuttle] data stops its accretion of new aspects/attribute sets. This before the rest of the entities, or even the Populace entity as a whole reach the same state. If one were to interpret this visual impression it is as though the space shuttle launch is successful, but that the space shuttle program is put on hold as a result of some non-shuttle related problems.

The Populace entity is also bringing us indicators that a large shake-up of Israel is coming this summer due to a leadership crisis. The [continuing] (failure) of [leadership] is described as being the root cause of a developing situation in which the [city] of (mud)[bricks] will be right at the [precipice] and whose [inhabitants/citizens] will (smell)[black][mud](reeking) of (sulfur) coming from the [river] at the (feet) of the [city]. Again we find notes indicating that this is [not] the (correct) time for [action] on the part of the Israeli's as they will be faced with both the [collapse] of their [leadership](body) {ed note: as it appears in the data } and the (sliding) of their [brick][buildings/dwellings] (back) into the (reeking)(dissolving)[waters/moat]. There are descriptors for some minor level of [chaos] as the events play out within the city which

certainly will need outside assistance, but apparently this very demand for assistance is what will trigger the leadership crisis.

We have isolated those areas of the data set which are linked to the papal succession. We note that far more data appears related to the process of selection than the result. Within those data areas we do find that the (lower) part of the [body] will (take/assume/seize) [command] of the process and that this is seen as not being a good sign. The data goes on to say that [discontent] will (rule) the (day). The discontent is seen as resolved, but with the [input/additions] of a (woman) who will (liberate) the [limitations]. However, our data suggests a less than smooth process to the selection of the next pope. We note that [strangers] (do not/shall not/will not) [respect] the (conventions/norms/social mean) and will (disrespect/denigrate) the (values) of others. This will induce a [public] (behavior) which the Populace will see as [self](despicable) and (degrading)[behavior]. There are also lexical clues leading to a more violent interpretation of the situation. As with all our lexical work, we strive for archetype extraction, so frequently, a 'cigar is not just a cigar'. In this case we find several disturbing references to the 'disrespecting stranger' as having a 'axe' and being 'armed' with (harsh)(feelings). While indicative of a physical manifestation of anger, it is not necessarily indicating an actual attack on anyone with an axe. What we do see is 'yelling' and 'shouting', as well as 'ridicule' all of which will lead to a very public [bad showing/improper display].

## Terra - Arctic Ignorance & Regret, USofA Hurricane Confusion

Our Terra entity gained some significant mass and new minor descriptors as we moved our part 5 processing into modelspace. While we get millions of geographic references, it is rare that these rise to the level of aspects. When they do this is usually indicative of the region becoming a point of public focus and thus rising in the over all public consciousness and therefore, their discussions on line.

This time the Terra entity gains an aspect of Arctic with a supporting primary attribute set of doubled, equal values for (ignorance) and (regret). Within each, we note that an aspect of [flooding] exists, although in each case it is of a minor nature, though each contain fully populated attribute sets. In one attribute set, descriptors going toward energy exploration/retrieval are present, and will apparently be seen as suffering from this flooding. There are indications that this may be referring to potential ANWAR drilling. The aspects suggest so, and if correct would have the enterprise 'begun in high spirits soon to come crashing down'. Or as is also found in the attributes, 'a fearless beginning soon stuck in a swamp'. There are lexical subsets with cross links indicating the opposition to the effort continuing, but these are found with the Populace, while it would appear the real show-stopper will arise from [water] (sealing) off the (shallow)[lands] with [oil](below). We find that within the supporting attribute threads imagery of 'herds and beasts in out-of-season movement' also associated with Alaska above the Arctic circle. What is clear is that the beasts are being driven out of the area by 'flood waters seeping up through grasses roots in marshlands' rather than human activity.

Within our Arctic aspect, we find a shift from 'restricted movement on the surface' as primary supporting attributes over to 'excluded from the valley by flood waters' as we move through into summer. While there are not very specific date ranges, we do see a clustering of aspects all linking to the days following the solstice and into early July as being the period when the 'seep' will begin. Further, within those data elements furthest out in time, we note a significant increase in supporting words for flooding suggestive of both a gradual sort of flooding as well as a gradual spreading of awareness of the situation. Within our imagery from our attributes we find that 'lake merges with ocean' and that 'valleys fill up, driving all before the waters'.

The defining aspect/attribute set for the Arctic minor aspect of the Terra entity also has considerable cross links to lexical sets referencing the

north west and north east of the Pacific rim. Further, both the Russian coast line as well as the Pacific North West of the North American continent still hold their aspects for earthquakes. At this point we have a strong indication from the cross links that the Arctic flooding will be coincident in time with the Pacific North quakes, if not caused by them. The indications are for a series of quakes which will affect both sides of the far north of the Pacific Basin as well as Alaska, north of the Arctic Circle. The previous ALTA reports suggesting wind storms are also supported here, with clear definition of at least one destructive 'wind episode' that coincides with the shaking in the north Pacific. This area of our modelspace goes to reinforcing the Summertime Quakes seen in Part 4. Again, the predominance of geographic clues are for the PNW of the USofA with lesser references to California and points east.

Also intimately involved with our 'lakes merging with ocean' are references which go back to the 'two cities awaiting disaster' noted in ALTA105. In this interpretation the data suggested that two 'mountains of people', our usual allegoric descriptor for mega-city, i.e. multi-million human population, are headed for disaster sometime this year resulting from either climate or earth tremors. Within that interpretation we note that one of the two cities will 'fall back or slide back into the mud', perhaps a reference to liquefaction during an earthquake. This city is seen as being located on the coast. The other is in a mountainous region which will present real difficulties to those fleeing the destruction.

Within this sections' data we note that our disaster scenario is picking up some more details. We find that references to 'geese' and other birds are strongly suggesting a North American location. Further we find indications that the refugees from this event will find (no) [solid] (ground/earth) as they (try/attempt/seek to) (walk) from the (coast). Instead this area is seen as [dangerous] in the extreme, presenting (quivers/shakes) such that (every) (four/4) (steps) (require/demand/insist) on (sitting)[down]. Yet this action of (sitting)[down] will apparently be also very (dangerous) such that (sitting) will be (spoken) [ill] (of). The lexical sets suggest that (three/3)

(days) after the [city] (slides) into the [mud], (refugees) will (arrive) at the [hills/mountains] and begin to (coagulate) into a [scattered/distributed] (nation).

These refugees seek safety in the [solid] (rocks) and (boulders) of the [hills], and apparently will consider themselves lucky in spite of the problems that will develop as a result of their place of refuge. We note that (no) [food] is available there and that (difficulties/obstacles/barriers) of all kinds spring up for those attempting to provide assistance. First the area is seen as so hilly as to prevent landing of aircraft. Further, the aspects/attribute sets suggest that air drops of supplies will be less than successful due to (fierce/warring) [winds] and inclement weather of all kinds from [fog] to (lashing)[rainstorms]. These storms are also seen as causing the second set of problems for the refugees, the [floods] that (carve) [ravines/cuts] into the [hills], washing away topsoil and substrates. Again, as with our previous interpretation we note that a surprising, and consistent reference emerges to [gold] being (exposed) in these storms.

We do find that after the first of the earthquake (induced) [storms] , a silver-lining will emerge from the [floods] which will cover the (feet) of the once-great coastal city, will at least provide [neighbors] from the (other) [valley] to (raft) (supplies/sustenance/resources) over to the [refugees] where an apparent, impromptu party will happen, with everyone (perched) on (large) [boulders], (happy), (eating) at (leisure), and with (new)[companions]. These [companions] have their entire lexical set hanging from [boats] and the sub aspects are suggestive of many small boats.

For the former inhabitants of the coastal city, the aspects/attributes do not offer a very plush future. Most are seen as becoming permanent refugees. Within our lexical processing we do get numbers that rise through the filtering. When these do we pay attention to the specifics of the situation, as we did with the 300,000 seen in last years runs as being damaged by the earthquakes. Within this data set, we note that (many)

[years] will pass with the (scattered)[nation] still in the [hills]. Our data suggests that it will be at least 30 days before [officials] are able to be present on the site, and that within this section of the data, there are indications that these same [officials] or their successors will still be (visiting) the (scattered) [nation] in the [hills] some (three/3) years later.

We must note that the use of the word 'years' is to be taken as meaning something far less exact than a 365 day solar year. In projecting the impact of emotional changes going forward, we are assigning values for words, and word shifts, as to the 'emotional carry distance forward'. These guesses as to emotive carrying power are then what make it through the processing as our indications of 'impact value' and 'duration of impact'. So we end up with the duration of impact values going over to the aspect of [year] within the lexicon. We have our time and date values separated such that it could have just as easily risen to the level of [decades] or even up to [saeculum] which is taken as being between 70 and 120 years {ed note: the range of the human life span; in ancient Rome, the period of about 100 years}. It would therefore make sense to interpret the '3 years' above into something more along the lines of 'a long time, perhaps longer than a year, but less than a decade'.

As a separate area we find lexical clues indicating that the hurricanes to strike the USofA this year will be [ten](years) (worth/value/total/sum) of (storms). The lexicon suggests that at some point the [confusion] of [colliding] (storms) sends (evacuees/refugees) (back pedaling/backwards motion), leaving many (trapped) (without/in absence of) (sight) due to (winds) and (wind) (driven) [rain].

Further, the [confusion] of [storms] will impact both the (answering/responding) to [requests] for (aid/assistance/help) as well as the (distribution) of (aid/relief/supplies/sustenance) afterward. The value of the impact duration is in the [decade] range. Supplies of all kinds are seen as being restricted in both availability, and movement once the storms are past. The image coming through is one of 'feel lucky you got that much' kind of period.

There are some rising level of indicators suggesting that our '10 years worth of hurricanes' will start the season early, and will be led by a [surprising/shocking/attention gathering] (lightning) storm.

Again we note a rising number of references suggesting that this years storms will come from very unexpected directions, in fact we still see the France and atlantic coast of France gaining accretion values suggesting a very close link to the bespoke [hurricanes] indicated to (crowd) in (with/having) (great) [confusion] of (mass) and (energy).

We also note that there is an aspect/attribute set going to 'depletion of resources' that is cross linked back to Populace and the sub set of descriptors for 'terrorism'. The suggestion from the data appears to be that the storm problems will delay or impede such activities, reducing them to 'wet grass in the field', a poetic way of saying 'non harvestable' or 'no good result'. In fact, the extreme of that phrase within our lexicon indicates the goal would lead to 'decay' or 'rotting in the field'. The attributes here would seem to be indicating that problems from weather cause problems all over, even for would-be attackers.

## Peanut Butter and Crackers

The title of this section is a bit misleading. We have two items to discuss here. The first is actually [food](contamination), rather than peanut butter per se. What we are picking up within the various layers of cross links suggests that some naturally occurring pathogen for [humans/mammals/animals] will be found within the (imported/exported/transported) food supply. The data suggestions that we have are less than clear. So what we will do is to present several possible interpretations of the few clues we have presently. In no order of rating:

- 1) the disruption of the food deliveries allows pathogens to invade basic {raw, non-processed} food material in transit
- 2) the basic food material is contaminated at the source during harvesting
- 3) the basic food material is contaminated as it sits awaiting processing once it arrives at the 'factory'.

We do see that the pathogen represents (risk) of (ill)[health/well being] to a large number of people. We also see that the pathogen is either plant or fungus based. We note that the pathogen would not be able to (take)[hold/root] without this period of [sitting](quietly). We also note that the end processing is in a [humid] area with [dark][red](brick) buildings of [one][story] and (many) [ramps]. Due to the inter-connected cross links it would appear that the buildings are made of distinct local brick from dark red fired clay. We have no other geographic references, but suspect from the other descriptors that an international food processing facility will be involved rather than merely some local warehouse.

Further we note that the use of the words 'peanut butter' were chosen deliberately. There as some, repeat, some SMALL number of items indicating that 'peanuts/legumes/seeds' as opposed to any other form of vegetable/grain would be involved. This small number was enough to trigger the 'peanut butter' reference for the title but not enough to suggest that actual peanuts will be involved.

What we see indicated suggests that the incident will be (discovered) and reported before there is widespread problems resulting. However, the impact is seen as being very large, perhaps national or international, with at least one of the elements contributing to the general shift of the public consciousness. It would appear that what is being suggested is a 'food contamination episode' that shakes the consuming public to the core, and causes very large scale changes in behavior. We note that our

behavior predictive 'impact' values are very high on this subset of inter-connected cross links. This is very suggestive that actual behavioral changes on large parts of the public will be manifest, and in the past has also indicated a fairly large chance that these changes will be formalized in some manner.

As to the 'crackers' reference, we have had our processing server IP address discovered by some interested crackers. While our processing is such that the data gathering is done on a server cluster, and then off-loaded during gathering in segments for further processing, it means that both our servers, and other processing computers have now to devote resources to preventing penetration attacks. This has limited our bandwidth run this time, though we were able to hit our data acquisition goals. The crackers are apparently not attempting to shut things down, merely to implant back doors, and trojans in the server software. We do not assume anything personal in this and are assuming that it is merely due to the OS that our servers run.

## Conclusion.

This is the last part of the ALTA 405 report. In total there are five sections. At a very high level view, the data seen is indicating that our rate of change is accelerating as we move forward from a period of relative quiet. In the main, our meta-level data growth rates indicate that more change will beset humans this summer than has been seen in some number of years. The rate of emotional sum primacy shifts are beyond anything in our experience with this technology. As such we are inferring that change rates which induce fundamental and lasting behavior alteration are imminent. We note that the 'distillation' of the social order over the summer and into fall promises significant upheaval and the wholesale 'abandonment' of 'past traditions'. The shifting of the

Populace and the hardening of the attitudes also contribute to a general impression of a very rigid, but fragile period that 'crumbles' all in an instant, leading to dispersion, chaos, and the 'dissipation' of the inherited view of the world. There is much within the data pointing directly to a complete change of the global financial structure. The change within the financial structure also contributes its part to the over-all climate of social storming. It is during this period of social storms that the universe will join in to hurl some real storms our way. These are seen as including rain storms which may stop transportation, storms of earthquakes which may alter landforms, and wind storms which may be strong enough to erode mountains.

Oh well, situation normal, all screwed up.
