

The information below is presented as entertainment only. Any use of this material in bets/investment or speculation which place wealth or resources at risk is *entirely* the result of mental aberrations of the reader, and the authors are to be held strictly harmless in such cases. The authors are blameless for any use of the material below for any activity as clearly such actions represent mental illness/instability on the part of *all* humans involved.

Today's (June 15, 2008) extract of Speculator Slices includes all data types. This is the last of the ALTA 209 series speculator slices.

1) The timing clues that we have attached to the words within the lexicon take their positions from the significant motions of our planet. We use the equinox and solstice bi-annual positions as primary markers and from there have split time into the intervening lunar months. In the current processing modelspace shows a distinct 'hiccup' occurring within the few weeks (now) prior to the solstice, and for the 2/two weeks following. Within the accretion patterns for this period out to just about midnight on July 8th, we have a probability of an earthquake creating a level of destruction on the west coast of continental north America, as well as the continuation of the [traumatic winds], and [dramatic rains] forecast for the central section of the continent. Further the appearance of the 'pressure cooker' summer over the east coast will continue, though there is some hint of a bifurcation coming in east coast weather patterns from late July onward into September. However, the pressure cooker label to the pattern comes from the excessive humidity, and heat, and the subsequent impact on the human infrastructure including health care, transportation, and power distribution systems. As various components of the infrastructure fail under the loads, the emotional tension, aka [pressure] perceived by the populace will increase.

All of these factors will combine (with other dire weather/climate symptoms) until there is a perception within the [populace/usofa] that the nation is suffering from 2/two natural disasters, each of which exceed the Katrina/Rita/FEMA disaster in scope, territory impacted, and national ripples.

The progression of modelspace is indicating that these emotional "set and setting" components (e.g. those parts of environment which directly affect the experience perceived) will be influencing the markets over this next lunar month both as a background pressure, and as immediate proximate causes of market activity.

The effects are suggested to manifest in the following manner:

a) Oil/energy - The whole of energy as a complex of 'investment/speculation' potential will be [on fire]. The [energy/oil] complex is filled with language such as [wealth], and [increasing authority/presence/command]. Note that much of the language for [energy] is also found within most of the commodities including [food supplies], and [precious metals]. We do note that a 'lag time' exists between accretion patterns within the various commodity classes, but in general, they are not showing any sign of 'retreat' at all over the summer. The data has been suggesting a 'spike' for some time in both [energy] and [precious metals]. We note that the current language set is FILLED with aspect/attributes for [dangerous positions], and [precautions against calamity], and [warning (of shocks) ahead]. We also note that there are specific references supporting the [energy complex] including the [oil] sub set which include [highest success], but also [misfortune/disaster in August]. At this point the interpretation is that the [August disasters] will be [affecting energy production] as well as [distribution]. This area is also extensively tied over to [power shortages/power failure] within the Populace/USofA entity, as well as via a complicated cross link group to the Terra entity, sub set [2/two disasters].

b) Precious metals - Over the next 2/two weeks a general trend of [catch-up/pursuit] will emerge within the [commodities] markets as everything [watches/follows oil]. Within this sub set the [precious metals group] will begin to establish a new relationship with [currencies]. This is likely due to [spikes] in [oil prices]. While the mechanisms are unclear, the [precious metals group], and [energy/oil] and [food supplies] sub sets are all 'on the same page' or 'in lock-step/marching together' in about 2/two weeks time. All of these moves are directly related to the [currencies] issues which will be developing in the background with lower levels of public visibility. This will include yet another lump of derivative problems within the 'credit markets'. This is also to say that over the solstice the relationships within [currencies] start to get [out of control], and the background pressures will tend to push all the commodities into [new behavior patterns] that *seemingly* will persist over July and up to/through the [August disasters].

c) Paper/debt/'equity' markets in general - The data sets accruing for the [markets, paper/debt/equity/credit/carbon trading] in general are indicating that over this last week prior to the [solstice] a [pattern of diagonal reversal] will emerge between the [paper/debt/credit] markets and the [commodities (in general, though led by energy first, then metals, then foods)]. This [dichotomy/duality] expression will be of an inverse nature which will become increasingly apparent through the [solstice]. For the [commodities] the background pressures are indicated to [drive desire], while the [paper debt markets] are shown being [bound] to the [currencies] which are indicated to take a large impact due to very [visible] increments of [globalism/corporate failures]. There are significant [visibility] summations for some new [secrets revealed] meta data layer impacts just past the [solstice] and into the following week. These are indicated to relate to the [currencies], and [banks], and include supporting language going to [course of calamity]. Further there are direct references to [cover-up], and [continuing efforts]. The data suggests that a long standing [cover-up] will be [revealed] in the weeks following the [solstice] and that the revelations will have significant impacts on markets stability. The primary supporting aspect set for this linguistic area is [upset/overturning].

d) Personal behavior patterns - The data sets are suggesting that the personal behavior patterns of the people involved within the various trading locations (NY, Chicago, et al) will be impacted by the pressure cooker summer components. The data suggests that those who are trapped within response patterns to the background pressures *and* who are unaware of being trapped, will *not* be acting 'normally' or [predictably]. There are clear pointers to [irritation] and [outbursts] due to [daily pressures] of a non cooperative local environment. There are some [visibility] summations for [bizarre consequences] which will be highlighted as the [unaware] attempt to reconcile themselves to

a 'disturbance' in their usual mental states. These effects will be subtle, yet telling to those aware observers capable of first observing the impacts on themselves. They will then be able to discern the effects on others. This will provide something of an advantage in commercial transactions/speculations.

2) Our modelspace is still indicating a very tumultuous Fall in terms of markets, currencies, emotions, military, politics, and other areas of human interactions. Further the data sets are pointing to a [planetary environment disturbance]. The indications are that this Summer will be a [pinnacle point] or [fulcrum] for the Markets. In general this will *not* be a good thing in the immediate time frame. There are some suggestions that our 'new social arrangements' will provide a 'way out' of some of the problems. But it will not be your forefather's world any more as planet terra moves into Winter. The point of [transformation] will have been passed.

Today's (June 8, 2008) extract of Speculator Slices includes all data types.

1) We note that the first appearance of the [pressure cooker summer] as forecast in this ALTA series is beginning to settle over the east coast of North America. The [pressure cooker] descriptor goes specifically to [high humidity] along with [exceptional/extreme heat]. The [high humidity] will be a key factor in that it will restrict the ability of humans and their infrastructure to shed heat. This is indicated to cause adverse impacts on the health care system over the course of Summer which will have regional consequences in October. This is a critical temporal marker at a number of levels, both for the populace in general, and markets specifically. Beyond the problems caused to those who are living under the high humidity, there will be 2/two other significant effects; the first is on the western by northern boundary layer of the humidity where the potential for extremely violent weather will increase dramatically, and the second impact will be on levels of flooding which will eventually merge into a more or less contiguous boundary layer of persistent floods. Other effects forecast include a large ramp up in disease both for humans and their animals, as well as a [disease] of the [infrastructure]. This last will include [molds], especially [slime molds] which will become a problem with electrical systems, as well as buildings [toxic molds], and which will also severely impact [waste disposal/sewage processing]. In this latter instance the temporal marker of the [pressure cooker summer] arriving will be followed in about 3/three months by a [fouled nest] of [waste treatment mechanical/electrical problems]. Market implications here.

2) It is said that there are 3/three kinds of beneficial friends: honest friends, understanding friends, and learned friends. Those who are active market participants over these next 2/two weeks will require all 3/three kinds of beneficial friends. The Markets entity, when populated with the recently processed immediacy values, and just moved forward in modelspace a small increment, shows that [like minded conspirators] will be [planning together] for [concerted actions] over the next week. Likely referring to the PPT, though the data does go onto suggest that [seizing an opportunity] will present wealth. We also have detail aspect/attribute sets for [meteoric rise] (by the end of the 2/two weeks) though this is *not* referring to the 'markets' in general, and likely is referencing the [commodities] including [energy]. There are other, more general aspect/attribute sets for [small time frames] which are then modified by [fantastic/incredible /very_unusual opportunities]. These modifiers are cross linked over to other entities within modelspace where we have reinforcing sets for [small/tiny moments (of) opportunities (coming from) manifesting chaos]. As a complement to the 'tiny moments of opportunities' the data also includes references to [great losses] further modified by [life taking/engery_removing]. This area has other lexical sets which are supporting the idea of [incredible losses]. The [visibility] summations are such that there is some probability that the first of these [gigantic losses] will also be appearing over the next 2/two weeks.

3) Conditions within the [silver/gold/precious metals] and [commodities] including [food supplies] and [oil] will be very [difficult] and [dangerous] over these next 2/two weeks. The data sets are indicating that conditions will be [feeling] as though [extremely cloudy], and as though a [storm] is about to [unleash energies]. However, counter forces will be pushing just as hard to [derail] potentials. The data sets suggest that [good advice] will be to [practice precision] of [thinking] prior to any actions. The issue is of the nature of [timing] of markets, as well as the [powers that be] and their [general agenda]. However, the general movement of modelspace indicates that the PPT and TPTB will be [lessened/reduced] by the [efforts/energies expended] in this next push and that the [flowing stream shifts] away from their goals over the rest of June. While there is a state of [grace] that exists within the markets, which is to say the [divisions] being more or less [constant], the data suggests that *all* the computer and other economic models will be [peeling (away) from manifesting circumstances] over these next 2/two weeks. The resulting [chaos] will be [blinding] to those 'managers' who depend on [predictable behavior]. This in turn will [aggravate] the [cloudiness] of the [markets] and will contribute to both the [staggering losses], as well as the [steaming lumps of derivative shit] which will be littering the markets over these last days of Spring and into Summer.

4) There are data sets suggesting that these last few days of Spring will have a small level of [visibility] to the [path/policies/actions] of the Bushies which is described as being so [disastrous] this Fall. The data sets contain some references to [torture instruments] and to [(secret) prisons], and this likely provides some of the [secrets revealed] about the [concentration camp fleet]. There are repeated references to [bad luck] which is [compounding] the [bad decisions] of the Bushies. Yet again we have language indicating that [officialdom] will be [saying bad words] which will be [inappropriate to the circumstances]. These [bad words] themselves are indicated to be a [problem causing] event, which contributes to [degradation] in general, and specifically to [oil pricing].

Today's (June 1, 2008) extract of Speculator Slices includes all data types.

1) The data accretion patterns suggest that June will bring a distinct 'sea change' to the movement and momentum of global markets. The patterns being seen at a very high archetype level suggest that [duality] will be expressing such that the [markets] in general, that is all

markets involving any [paper or digital transactions], will be heading into a [bad summer]. The sea state change will develop over these next 3/three weeks prior to the solstice. Then the bad summer begins. It will be followed by a strange Fall, and again, the recurrence of [bad] in Winter. The accretion patterns suggest that Robert Hitt's (www.astroecon.com) warning about 'potential energy' in mid June may be quite appropriate to the shifting nature of the times.

The individual lexical sets which are accruing for Markets for June include [yoke/binding/union], as well as [responsibilities/burdens] as primary supporting aspects to the [markets] sub set. These will be dominant from June 1st through to June 24th. Coincidentally this is when the earth sun relationship shifts out of the 3/three day holding pattern of the solstice (latin for 'hold still the sun'). These linguistic sets are pointing toward [responsibility] as modified by a [greater social context] as being the prime mover of the markets across these last days of Spring. The end of the solstice is also coincident to the rise of the [visibility] summations for the [bankruptcy] context discussed in part Four. We also note that the [yoking/binding] could be interpreted as [mergers/joining], and even includes [wedding] within the set. In this case we note that both [merger] and [wedding] are extensively supported. The [merger] aspect set contains many supporting aspect/attribute sets going toward [crumbling], and [dissipating].

The emotional summations for the [responsibility] and [yoke] sub sets within Markets entity yield a lexicon link which is dominated by [worn mechanism/transport] and [exhausted fuel]. This area is also filled with many references in support of our forecast from 2006 that [planes will not fly]. As there are a number of detail sets of divergent natures within the [yoke] and [responsibility] sub sets, the interpretation is that [mergers] and their [failure to fly] will apply in a general sense through June, not only to airlines. The [dissipation] aspect set keeps rising as support as we examine each of the many different types of [yoke] and [responsibility] supporting sets. The repetitious nature of the [dissipation] aspect set points to it being a general modifier to our 'theme' of [union/mergers].

As modelspace is progressed through June and across the solstice period, the primary aspects shift from the [responsibility (to the broader social context)] and [unions/merger/yoke] into [damaged/limping/crippled/hobbled/wounded]. This aspect rises in the last 10/ten days of June, and escalates in primary support as the supporting aspects for [responsibility] and [yoke] are falling. This is specifically referencing the [paper] and [digital] markets. There are supporting aspect/attribute sets for a [digital interruption] following the solstice. This is likely referencing the [inability] to [electronically transfer currency]. It appears to be an [international] problem, and though reasonably short lived, it will have a very dramatic impact which itself sets up an echo for later in Fall (November 2008).

2) There are a number of new supporting sets for [silver] and [gold] within the [monetary] context which are rising over June. The highest levels of summations indicate that an [emotional period/time] will develop which is indicate to [propel/drive] [silver] to what is described as the [first name on the list]. As this area is heavily cross linked from Markets to both populace entities, we suspect that the modifier of [desire/lust] will resolve to [silver] being the [first name on the desire list of the populace]. As the modelspace is progressed through Summer, the rising aspect/attribute set for [silver] shifts to [ascending/rising]. Our data shows the accumulation of supporting aspect/attribute sets under [precious metals], and specifically under [silver] to take a large jump just prior to the solstice. The dominant emotional summation value links over to [great vigor/robustness/big_life_force] as the primary supporting aspect/attribute set.

Please Note: The values upon which we make forecasts are *not* pricing related. We use an emotion reduced to number value system of our own devising. These numbers have *no* relation to price. While it is true that our rise in emotional values for [gold/silver] has proven itself in general over these last few years, it must be understood that the markets for precious metals are as manipulated and controlled as are any of the paper markets. Also note that in proof of the previous statement, we have now 'encountered the scarcity' which has been forecast in years past by our work. This [encounter with scarcity] has been discussed globally, and has resulted in the US Mint now rationing the amount of silver eagle coins for all dealers. In most cases the primary resellers of the US silver eagle coins are receiving only a fifth of their actual capacity for sales. Yet has the price risen to reflect this demand? No, not anywhere proportionate to a reduction to 1/5 (one-fifth) of demand. So trading in the silver/gold markets *HAS* to be undertaken mindful of the huge extent of governmental/officialdom control being exercised. Yes we are receiving indicators that the control is breaking down, but at what point, and to what level has yet to be demonstrated.

The data sets accumulating for precious metals include [everything falls into place], and [advancing], and [ascending]. They also include some sets as details suggesting that [trading] will be [very bad] over Summer, and perhaps a real time to take a vacation. The [trading] sub set includes the base level of descriptors about [trading] as an activity. So the comment is not on the nature of the markets so much as the [ability to trade] itself. This may relate to the [time/timing clues] which have been showing up as frequent, though emotively neutral, supporting sets for Markets entity for some months now. There are cross links between entities suggesting that [terra intrusions] or [bad climate/storms] will also impact [trading ability] over Summer.

3) The data sets accruing in general for Markets entity in June are *not* favorable. Perhaps not as bad as those coming in for Summer, but certainly not a jolly good group. The top level rising aspect/attribute sets are dominated by [dangerous position]. This apparently refers to the markets as a whole globally, rather than any specific 'position' or [trade]. There are also specific references for [writings/contracts] which have been [penned/inked] in Spring. The [wealth] represented in some very large [writings] will be found to be just so much [paper (in a) dead car/transport]. The data sets are also indicating that [transport limps] and is [pushed along] as though a [weary unto dead animal]. This area is cross linked over to TPTB entity where the termination points end in [shock] and [frightened], and [authority]. These all contribute to the [movement/reaction] of [officialdom] which will basically exacerbate an already bad situation right up to the point that the [car/transport falls over the crag (into the abyss)].

4) Specific points in the [bad summer] include large numbers of references to [high land/mountain retreats/vacations], and to [electrical consumption]. The former is shown to suffer the [woes of transports], while the latter is supported by sets describing [abnormal patterns

of electric consumption] which [strain] the [resources nationally]. There are some supporting sets indicating that there are [weather] related problems, but also the [unexpected] apparently arises as [people stay home], and thus some areas see much more demand, while usually tourist crowded locations are [light users] of electricity.

Today's (May 25, 2008) extract of Speculator Slices are from immediacy values and shorter term value sets, and first of the longer term values extracted from the ALTA 209 series.

1) There are still continuing accretion patterns for the [precious metals] which are focusing on [silver], and at the primary support levels, indicating that [silver will lead]. This is also born out by the support aspect/attribute sets for [gold] showing a [slow(er) growth]. The patterns themselves are also reinforcing the underlying linguistics as the data accrual rates are running nearly 3/three to 1/one in favor of [silver] over [gold]. So at merely a context/phrase counting level, there is considerably more 'chatter' about [silver] out-and-about in the speculations focused language. We have another data metric in which the 'mythological' component of a context is sampled. So in the case of precious metals, we have the 'myth component' of gold including [sun, heaven, winds, single], and with silver the component includes [moon, earth, thunder, dual (two state)]. In this metric the mythologic count for the precious metals context is running slightly over 4/four to 1/one in favor of [silver]. Yet another indicator that larger amounts of emotional analogues for [silver] are showing up as opposed to those for [gold]. Once again, a 'silver to lead' indicator.

The accretion patterns are still favorable for the rest of Spring for the precious metals, and most other commodities, relative to paper currencies, however there are 2/two distinct spikes showing for [silver/gold/precious metals] as manifesting before Summer. Thereafter the shorter term value sets are indicating that Summer will still favor metals over currency, but perhaps not in the same amount as was the case in Spring. Still, the precious metals are seemingly pausing during early Summer, and co-incident with political unraveling (especially in Pakistan and Iraq) in August, the metals again start to 'pressure' against currency. However, please note that our longer range value sets are indicating that currencies in general are going to be 'risky business' at a number of different levels by Fall so timing for speculative trades needs to be performed against the constant background awareness that 'this trade may be the one in which I lose all due to lock-down'. This 'lock down' is an aspect descriptor which has been showing up for some months now, and is focused on Summer and early Fall, and is being interpreted as a Big Something Unknown which makes the [markets] seize up suddenly. This may be electrical in nature, or a natural disaster, or a governmental edit. This is a case of our lexicon *not* having an appropriately defined context so we end up with more [unknown] aspects than filled/populated sets. This reduces our ability to supply the missing pieces. What we do have is indicating that conditions will emerge which will make it unlikely that 'recovery' of an 'investment/speculative trade' can be 'made manifest/actualized'. The idea is that a Big SomeThing Bites Here will block the ability to 'retrieve' any 'value' from the trading. So fair warning that our data is grimly continuing to suggest that market speculation in these days in this time in history is a 'proceed at own risk' situation in which the speculator is presumed to be maturing into an idiot, and getting more so by the day. This is the long winded way of saying that don't count on paper, especially paper versions of precious metals. Probably waaay better to have the metals themselves, than a paper promise to deliver. It may well be that the sudden turn into release language in October is an indicator that the lock-down is in effect on that date. We await more clues as universe sees fit to provide.

2) The data sets continue to provide future clues indicating that [hyperinflation] is *still* a pending/building issue, without regard to the argument that hyperinflation has already manifested in energy and food. The data indicates that we [ain't seen nothing yet]. The pending levels of economic chaos can be expected to [goose officialdom] into action. Unfortunately our data indicates that the actions which will soon be displayed will be entirely wrong, both in direction, and order of magnitude. The reactions indicated to occur within the paper debt/speculation markets, *especially* at the level of *interest rate sensitive derivatives* will be described as [staggering] in the global mediastream. Some of our [drunken sailor] language can be applied to the reaction of the [markets] as they are shown to [reel] and [sway] without [direction] and to [stagger (in anticipation of) collapse]. Again this may be a Summer behavior which then reaches the final 'push over point' in early October when we get the release language shift.

As part of the [derivative stinking pile] forecast for this Summer, we have language which seems to indicate that the reaction to the [officialdom actions] will be to perceive it as [abandonment], [betrayal], [loss], and [severe limitation].

3) Within the Markets entity, and the cross links over to the 2/two populace entities, we have an evolving situation which should surprise no one, and in which the [energy complex] will continue to dominate. Using the immediacy data outer edge boundary of 3/three weeks, the data sets indicate that the [energy] sector will be continuing into [hyperinflation], as the [populace] within the [developed world], which is to say the [oil dependent world], will shift to a [key/critical mass] point relative to meme of [energy]. Clear as government hedonic maths? Well, stated another way, the data suggests that the continuing price instability within energy (oil) et al will introduce some instability into the developed world popular consensus about the future. This is a *BIG* thing, though as with a wave, it will not be all apparent all at the same time. Rather we will see that the mental construct of the future for the populace will have crossed a significant tipping point over the next 3/three weeks. This implies that something over 1/one per cent of the populace will then be [acting] on their developing world view, while something over 3/three per cent of the populace will be actively struggling to integrate a new view of the world and future, as their old mental model has collapsed beyond repair. This is significant as that 3/three per cent of the populace will be thrashing around, not yet settled on a new view of the future, and will thus be contributing to [gyrations], and [extreme reactions] as they attempt to salvage something of their previous life, and try to cope with the [grief stages]. Neither of these should be minimized, as it may well be that those struggling to get to a new view of the future sans oil will react by suddenly withdrawing pension funds, and to hell with penalties. Further the data indicates that [runs on pensions] are the probable result of the follow on to this initial 3/three percent wave of 'early adopters' to use the software model of group dynamics. In addition, the [grief stages] will be very real as this cohort reacts as

individuals to the 'death of their former world view'. The issue is that now, due to their having crossed the 'sensitization threshold', they will see evidence of the 'collapse' of their old world everywhere. This is hard enough to live through as individuals, but when many of those around are also going through this level of shock and grief it has a tendency toward magnification of extremes. Note then that the 'indicators' that officialdom uses for prognostication on economic activities, all backward looking, will be showing the effects of the change state within the populace in the next few months though the drama of it all starts now. We can expect a wave of press activity about the currents moving the populace over these next few weeks, *but* as they are also a lagging system, the main body of stories are several months off. This press coverage will initiate yet another, and larger wave of similar activity. It would not be surprising to find that at least 2/two distinct waves of [withdrawals] from various financial systems occurs, first over these next 3/three weeks, and then later in July/August. As a side effect of the personal thrashing around as people process the changes in their suddenly shifted world view, expect that this June marks a period of a number of months, perhaps even years, in which all kinds of 'conspiracy theories' are found to be actually descriptive of conspiracies which occurred. Sort of a wave of [truth out] around huge numbers of past behavior on the part of the ruling elites.

4) Modelspace is suggesting that the next 3/three weeks will reveal both the [fracture/unsettled] nature of current [alliances/elite affiliations], and new alliances. The data patterns are suggesting that both political and business alliances revealed over the next 3/three weeks are rising in response to the [dying dollar], and that the changed international political mindscape will totally alter the ability of the Anglo dominated paper debt markets to continue. There will be some discussions of the phenomena within the Press which may provide hints as to the shape of the future international order, but most of what appears in print and video will miss the actual mark of what has occurred (over these next 3/three weeks). We expect that Russia/China alliances are merely the start of a new trend which ends up isolating the paper dependent, oil dependent economic block.

Today's (May 18, 2008) extract of Speculator Slices are from immediacy values and shorter term value sets extracted from the ALTA 209 series.

1) The [gold/silver (and other precious metals)] context has gained the aspect/attribute of [advancing/progression (toward) goal] as its dominating and rising primary support. As modelspace is progressed through the most recent immediacy values {ed note: immediacy values = 3/three days out through 3/three weeks; shorter term = 3/three weeks out through 3 months; longer term = 4/four months out through 19/nineteen month (with some granularity out through 21/twenty one years)}, the [gold/silver] context gains the [advancement] aspect/attribute set and it continues to grow through the rest of Spring at an increasing pace. This rate of increase does not abate until after the June 21 solstice. NOTE: what we are measuring and forecasting are *linguistic* based metrics which focus on the *emotional tones* within human communications. This does *not* translate directly to price on any given item. There may indeed be some corresponding change in prices, but the forecast is for the emotional tone around the context. It is possible that [desire] could exist without any means to fulfill it, such as everyone desiring to buy gold, but having no means to do so. IF such a situation did arise, *AND* it was written about in the global mediastream, then we might pick that up as the [increase] sub set as this refers to the underlying, which is to say, the motivating emotions, and *not* necessarily the ability to act on those emotions. Clear as the PPT's transparency at midnight in a dark alley?

So....the rising, and dominating aspect/attribute set for [gold/silver] over the [rest of Spring] is [advancing]. Now please note that this is the active form of the context label which does imply that it will be [actively changing]. This also implies that the [rate of change] will be more continuous, rather than focusing on a single, or few events. A quick linguistics lesson would show that [advancement] would/could be interpreted as being 1/one or more [points of advancement], but that [advancing] is defined as a [continuous progression]. So our interpretation is for a [period of continuous advancements for the gold/silver/PM complex as commodities]. This period is constrained within our modelspace as being [over the course of the rest of Spring]. We *do* note that conditions appear to change generally after the June solstice and the transition into Summer.

Within our [advancing] aspect/attribute set, the first layer of support has a focus on [paper], and explicitly references [paper] at the primary level. This *may* be interpreted as a [situation (in which) paper trading/forms of gold/silver will have a greater/faster rate of increase than the actual commodities]. It can *also* be interpreted under the [duality] meta data layer influence as pointing out a [divergence] or [split] in some form between the [paper] and [actual] forms of [gold/silver].

Within the secondary level of supporting aspect/attributes for [gold/silver] the support leads to an interpretation that the [situation/conditions are incomplete]. And further that the [paper markets] are specifically referenced here. So this aspect/attribute set can be applied as a modifier to the [advancing] in the sense of an interpretation that an [incomplete situation develops around gold/silver paper trading during/causing advancing emotional desire (for gold/silver)].

As the modelspace is progressed forward through Spring, the data sets indicate that the [situation] within [gold/silver] and the [paper markets] will [induce/cause officialdom (to) weep] and to [cover/hide their faces]. There are further supporting sets under the [weeping officialdom] aspect/attribute sets which go to [repenting arrives (too) late], and this in turn is supported by [no way/manner (to) avoid trouble].

There are many 'cautionary' sub sets which accrue to the gold/silver context over the rest of Spring. These include some descriptors which go to the idea of [disappointment], and [rules/rulings/judgments] which are described as [not turning out (the way) desired]. These are supported by later accruing aspect/attributes for [weighing potentials/possibilities], and [choices (demanded) to be made]. The data sets go

specifically to support showing that [laughter/laughing (at) officialdom] and [officialdom (too occupied to) cry].

Further sub sets acquired in early June show that the [duality] meta data layer is very visibly active in that the [officialdom] position relative to [gold/silver] is described as [withering] and [shrinking (down to) emaciated limbs], while the [gold/silver] context gains aspect/attributes specifically going to [good fortune/outcome (following a) long spell/incantation covering of bad luck/joss]. This last is seemingly pointing to the [removal of the curse/spell/incantation] after a [long period/time/years of residence/inhabitation]. There are some more minor aspect/attribute sets in support which may be providing a temporal marker for the [withering] in that an [appointment] with very high [visibility] within the global medistream is seemingly concurrent with the [withering], and the simultaneous [removal of the spell/incantation].

At the very core as well as the terminating aspect/attribute sets, the [advancing] aspect/attribute set contains references to [piles of gold] and [coins of silver]. Hmmm. Probably pretty clear on its own. But if these references were to be found in some other aspect/attribute set within another context, they would be generally interpreted as descriptors for [riches/wealth]. Here they likely should be interpreted more literally toward actual [gold/silver metal coins et al]. The point here is that as the [advancing] of the [gold/silver] occurs over Spring, there will be a concurrent rise in [visibility] of the subject within the global medistream.

The [gold/silver] context also contains some details indicating that a [crisis] for [officialdom], presumably the cause of the [weeping], will arise such that [3/three meetings] will take place within a [single day] with the [advancing] as the subject. These [meetings] are all likely in the same [white house], and are all shown as being [visible]. The [sense of urgency] for the [meetings] has less emotional summation than the [sense of finality] which is also in support of these aspect/attribute sets.

Please note that [advancing] does *NOT* imply a steady state upward. It specifically includes descriptors for [turned back/repelled]. It also includes descriptors for [perseverance] and [overcoming obstacles].

Also note that there are strong, late Spring associations between the [female personality] of the GlobalPop entity set and the theme of [uniter/union] which are also in support of the [advancing] of the [gold/silver] sub sets. These references are obscure, and not being further interpreted at this time.

With the maturing of Spring, the [advancing] sub set gains values for [unhappiness disappearing/leaving] and [goals completed]. There are further supporting sets for [large numbers/millions (of people) being (in) accord/like_minded]. During this time the data sets are showing that the [visibility] rise will include a rather prominent story within the global medistream going to the idea of an [agent] who [sells off/auctions off] the [antiques/famous pieces] for an [old woman/lady] of some [wealth]. The story will apparently include both the [values achieved], and the [complete honesty] of the [agent]. This appearance of this story can be taken as a temporal marker for the [rise (to the) first peak]. The story likely is related to the general trend at that time of [disgorging] which [officialdom] had been [wagering/betting] would [stem the flow]. However, the [rich old woman selling antiques] actually represents the [next wave up] for [gold/silver] as the [officialdom continues to weep]. Please note that *following* the appearance of this story, with its focus on the [honesty] of the [agent], the data sets are indicating that [good situation (does not) last forever], and that [chaos comes/follows]. The idea being that yet-another-state-change comes at some point in Summer, and that [plans] need to take this into account.

The data set accretion patterns suggest that [gains] and [losses] should not be taken too seriously, as the fading of Spring points toward [new opportunities], though they will *not* be repeats of the patterns seen in Spring. Rather the data sets are suggesting that [summer] will be [tepid] relative to [gold/silver], and that [fall] will be [terrible] in too many aspects to care about [gold/silver], but that [winter] once again returns the [metals complex] to the [advancing] trend.

The data sets in support of the [advancing] through Spring of the [gold/silver] context include specifics going to [special talent/conditions /ability] especially with regard to [silver]. This is in its turn supported by direct references to [visible expressions/discussions/incitations] to [cash in on it], as well as to [profit] from [current conditions]. Also within these supporting sets are admonishments to [uselessness (of) last minute efforts/plans/attempts (if) no preparatory work has been completed]. The [pile on to cash in] mentality is specifically *not* shown as being effective, in that the data sets are indicating that [too much is dangerous], and that [dangers (for the) paper markets] are [exposed] during the late Spring.

Today's (May 11, 2008) extract of Speculator Slices are from immediacy values and shorter term value sets extracted from the ALTA 209 series and the last of the ALTA 1308 series longer term data sets.

1) Both the immediacy values and shorter term value sets are bringing in via links to the lexicon, a group of longer term values which, within modelspace, should be housed within the Bushista entity. These are pointing to a situation developing in which the [collapse, final gasp] of the [dollar], and the [sinking into poverty] of the [populace], will form a 'phase 1/one' of a [denouement/crises], and the [military defeat/minutiny] will form 'phase 2/two'. This [conjunction/combination] will express a kind of [duality] which will lead to the [questioning/calling_out] of the [bushies] as [leaders]. This may also include the [cries of treason] and [corruption (to) death] by [bush and cheney]. The timing of this, as indicated by the longer term values, will be from November through to the end of January. This area of emotional tension does participate in the [revolution] meme, as well as springing from the [calls for early election] meme base. This is pertinent to speculators as the data sets within Markets for the time are showing that [pogrom] and [investigations] and [repudiations] and

[arrests] and [incarcerations] are some of the aspect/attribute sets which are rapidly rising in emotional values for that sub set, and time. The idea coming across from the data accretion patterns is that a [conjunction/combination] of circumstances will [open an investigation] into [political corruption] which will spread like [fire] through the [markets] in that many of the [elite/upper_eschalon] will be found to be [involved]. Further [damage] is done to the [markets], as is indicated by extensive cross links over to the GlobalPop entity, by the [secrets (which will be) revealed] in the very early stages of the [investigation] as these will [expose] the [dollar manipulations] in such a way as to [alarm] the [global populace], and thus triggers the [repudiation] of the [dollar] at the [lowest possible level of use/interpersonal trading]. It will be such a [devastating blow] to the [economy/mechanisms/systems] of the [paper debt trading arenas] that whole [cities] will be [brought to ruin] as a [result] of the [abandonment of the dollar]. The data is also pointing toward the [Bush regime] as being [indicted] with this component of [crime] as well. And that further fuels [investigations/trials] into [business] offices in a [covering/encompassing manner]. The data sets are further pointing to many within the [media controllers] who will be first offered as [sacrifice] to the [revolution] meme as it sweeps through the [social order/social structure] as the [dollar] lies dead, and the [usofa military mutinies]. Hmmm. November onward....suggesting that it will take only a single lunar month to bring out the [secrets revealed] from the [october 7th] change over into [extreme release language]. As a last note on this area, the Bushista entity and the TPTB entity have bespoke [fear (of) execution/assassination] as the top set of aspect/attributes from mid November 2008 all the way through Spring of 2010 when conditions are dramatically different.

2) As our modelspace is progressed over late Spring and into Summer of 2008, the data sets accrue in patterns suggesting that [hyper inflation] within specific areas will become [visible] in ways that will bring large levels of [national discussion] in countries around the globe as to the [advisability] of [continuing to trade] in [dollar denominated assets]. Further damage will be done to [usofa real estate markets] by pending circumstances which come to light in early June, and coupled with this are [secrets revealed] which will *not* be publicly [visible] until Fall, but which will be [rumored] to be in [private circulation] over July and August. Along with this persistent [rumor] will come a series of [incidents] which will [alter/change/rock] the [chinese olympics] *and* which will impact the whole of the [energy complex], further [fueling/driving] the [hyperinflation] in [dollars]. As the [foreign discussions] begin to become [visible] within the [usofa] in early June, the data sets indicate that a [series/group/continuance] of [confidence altering/changing] circumstances emerge which [break/fracture] the [social order] here in the USofA. It is this [fracturing of the social consensus] which raises the [potential/probability] of [revolution] from a mere 'catch phrase', to [serious concern/discussion] within the [halls of the petty_people/politicians]. This is the [straw] on the [populace's back], that is the [loss of confidence] which sets the [wheels of destiny] rolling across the markets and globe in mid to late July.

3) We are now able to discern from the data accretion patterns that the [more ebullient mood] which we have had forecast for July/August of 2008, and which was seen as [breaking] with [finality] in late September actually derives *not* from the [populace], but rather from the previously mentioned (ALTA reports 209) [propagandists push]. This [ramping up] of the [propagandists], who will be [pushed to maximum output] by the Bushies/TPTB, is what generated the idea of the [more ebullient mood]. In fact the data sets are now showing, as part of the expression of [duality], that the [populace ain't buying it], and that the [plans] for the [6/six month propaganda blitz] are to be [canceled] after only [2/two months] due to the *huge* level of [emotional rejection] by the [populace]. This period will be coincident with the PPT and [other players] who will be [desperately] trying to [prop_up/support] the [dollar] over the course of July and August. The [propaganda putsch] will also be a proximate cause for the Fall [investigations/indictments] of the [media moguls/oligarchs] here in the [usofa].

4) The immediacy data continues to accrue around [species extinction] and [food shortages] for the rest of 2008. Such items as [shellfish species loss], and [benthic habitat destruction] will produce a feeling of [kneeling at the edge of the precipice] within a significant part of the [populace]. This area is directly connected to the [diaspora]. This area is gaining very large support for [displacement], and [relocations], and [emigration], and [migration]. This area is seeming to indicate that a level of [migration] unheard of since the beginning of the Industrial age will start to gain [visibility] over [summer] as the last of the 'stable days' brings out such articles within the global mainstream media. The idea coming across is the [abandonment] of current [civilization] as new groups of self organizing collectives begin to feel their way together across the planet. The rise in [visibility] of the [voluntary/involuntary diaspora] will be accompanied by a very large increase in [doom] language. This [doom language] will be significant as a temporal marker as it is a pre-echo of expressions of [angst/anxiety/despair] which come into [visibility] in Fall after the [loss of money of the masses] occurs. Of course, both the pre-echo, and the later appearance of the [loss of money] will impact *all* USofA financial instruments.

Today's (May 4, 2008) extract of Speculator Slices are from immediacy values extracted from the first processing of the ALTA 209 series and the last of the ALTA 1308 series longer term data sets.

1) The highest levels of support for the context of [markets] is headed by [exhausting]. This is supported by such language as [exhausting (all) resources], and [difficulty], [hardship], [harsh conditions]. Further support at secondary and tertiary levels includes [difficult position], [tenuous situation]. At lower levels of detail support we have [surrounded by enemies], [poverty stricken], [poverty encountered], [extreme poverty (propels) change/transformation/revolution], [extremely tired/exhaustion]. This language goes to the support of [markets] as the context headed by [paper debt/instrument trading], and is accrued over the rest of the month of May. The core of the [exhausted/exhausting] sub set itself is now being supported by [encircled/enclosed] by [rough fate/restrictions]. This in its turn is supported by aspects/attributes for [no more growth], [hemmed in/enclosed in].

In the [markets] context, as the sub set progresses across May in modelspace, the [exhausting/exhausted] aspect/attribute set gains considerable emotional strength from the aspects of [draining away (liquidity)], and [pool of liquidity dries up]. These in turn are

supported by [bankruptcy (of) banks], and [restrictions (of the) hidden situation]. This last is supported by [restrictions (of) movement], [obstructions], [oppression (of citizens/workers)], and [gloomy exhaustion (of) resources]. These combine to provide increasing pressure on the [markets context] as May progresses. The entire support structure for the [markets] as [paper trading] vehicle presents as [unfavorable] over May, with the longer term values bringing in the idea of a [crushing], and [fainting] period in June. Within the larger context of the populace entities the [markets] sub set has longer term values going out over 3/three years indicating that a [great/huge transformation/regeneration] is currently underway within the [social order] which will [dominate] the [markets] from this Fall onward. The Fall is pertinent to May in that the [trends/patterns] revealed over May/June (transition from Spring into Summer) will be able to be used as forecasts for the larger patterns which will express over the next [3/three years]. These patterns are shown as being [paper markets affecting/controlling], and are described as [naked butt (on) cold petrified wood (in a) gloomy valley]. This sub set gains its support from [naked/exposed/without pretense], and [cold/weary/tired/exhausted], and [petrified/calcifed/of_ancient_past], and [gloomy/dark/lowered vision/not clear], and [valley/split/trough].

The other primary support layers for [markets] for May, {ed note: actually later in May through early June}, are headed by [poison stings], and [dangerous penetrations (of) surface layers], and [rocked (with/by) exhaustion/unsteady_hand/control]. Further direct support for bespoke [misfortune] is held on a very broad scale. The [misfortune] is supported at its primary level by [planetary/global], and [distraught outcries/expressions]. These aspect/attributes are supported by [damages] which are described further as being [returned/put_back_upon] those who [inflicted] the [damage on others]. There are repetitious references to [rocks/crushed_by_rocks] and other language going to the idea that [hidden elements/rocks/obstacles] will [trigger/precipitate] several [reactions] producing a [loss of vision] even into the [closest range]. These [hidden shoals/rocks] are also described as being [unavoidable], and [destructive] to [controlled balance]. The [encounter] with the [rocks] produces [loss of equilibrium], and is shown as placing some [speculations] at [extremes of risk] without the parties [awareness/knowledge].

2) The [precious metals/gold/silver] sub sets when progressed through May along with the modelspace are headed by [progress/enlargement], however note that this aspect set is supported by [gradual], and [developing gradually]. The supporting language goes to the idea that [after being (held) still] there will be a period of [daily/gradual progress/growth]. The data sets are showing that May will be defined, for [gold/silver] as being a [turn around] in which [control/held_still] will [fall away], and [progress/growth returns]. There are further sub sets pointing toward the [growth] within [gold/silver] as producing a [party/happy atmosphere] for many speculators, but be advised that an [assault] by [paper debt invaders] will come in late May. This [assault/invasion (of) paper debt] does not succeed in its goals, and this is shown as putting the [authorities/holders/owners] of the [paper debt] into a [quandary]. This will be an [international quandary] with many of the [paper debt holders] deciding to go with the [trends] for [precious metals], though this will not be evident until later as we enter June. Several [expeditions/explorations] will come back with [no results], and this [increase (in) paper debt speculation] will [collapse] as the [expeditions/explorations] are shown to be [false]. These then set the stage for June and subsequent movements in Summer. There are some levels of support for a [great dispersing] on the part of the [paper debt addicts/controllers] which *could* be interpreted as a [deliberate unloading]. However we need to note that if it is a real [unloading] or merely language threatening such, the result will be that the [total release] will be [eaten] within [hours] by [greedy hands]. Hmmm. Probably not good for someone.

3) In a general sense, the month of May shows as a time of [great/huge possessions] which are supported by [no sense/grasp of possessions]. This confusing set of linguistic structures is composed of details suggesting that a [nothing/no_thing/no_possession] will result, but that the movements of markets in May will include the [flow of great possessions/volumes] through many [hands]. The data further goes on to describe the month as being filled with [petty_peoples/politicians] who will [lead/bring disaster] through their actions in the midst of the [shift of possessions]. There are numerous references to [faults], and [discriminating/separating], and [failure(s)], and [communications]. This last is supported by data sets pointing toward [flying in liars], and [false/fake communications].

4) We continue to see building value sets within the [pharmaceutical] sub sets around a [debacle] which will [spread globally], and which is associated with [eggs]. The [eggs] reference *may* be misleading, that is to say it may be a [germination] issue, or some other descriptor within the [eggs] sub set, *or* it may relate to [infertility], in any case though, the result will not be good for [pharmaceuticals] as we know them today. The impact levels are shown as being several years, perhaps as many as 10/ten years in duration, with very high intensity spikes over the near term (say, 2/two years) and a trailing off of the meme after that.

5) There are still gathering value sets for a [regional power outage] which will affect the [usofa] over this year. The data suggests that the [power failure] will cause a number of [related problems] within the national infrastructure such that it becomes [increasingly difficult] to [repair the damage] as the months go by. The impacts are shown as lasting over 6/six months, with significant problems and pressures being created on the economy as a result. There are no immediacy values presenting suggesting that it will happen within that time period, therefore we conjecture that the power loss is at least 3/three weeks out, and perhaps as much as 8/eight or so months away.
