ALTA IR - January 1, 2005
Part 1 - Terra - Rising To Exhaustion

Asymmetric Language Trend Analysis Intelligence Report
Changes in language precede changes in behavior.
By Tenax SE for HalfPastHuman.com

8:22 AM PCT Thursday
This 'draft' section of the report is being posted   now, and access is being pro-vided due to Geo. Ure's mis-statement on his site   about the report being avail-able.
Rather than allow the anxiety created to build until   I can get through the data/ modelspace linking and finish the report, which was   expected to be posted on Saturday, I am posting this section now. Bear in mind   it is far from finished and this necessarily delays the rest of this section's   processing, but circumstances being what they are, calm is called for, so for   those who were 'agitated' by Geo.'s site, here is what we have so far.
BE AWARE that processing frequently has me going   back and re-interpreting areas based on the next level of data being processed.   CHANGES are frequently made as new data comes in. THIS IS NOT A FUTURE PREDICTION   TO RELY UPON.

harmless and blameless for any and all such mental aberrations on the part of the reader.

01.01.2005 Terra- Rising To Exhaustion

Note: Entities are identified by a blue typeface. Aspect words are enclosed in square brackets []. Attribute words/phrases are within parentheses (). Interpretive editorial comments are preceded by an asterisk *.
Dataset distilled from 18.2 million reads.
Terra - Rising To Exhaustion
It seems appropriate to begin the interpretation with the largest of the objects currently populating our modelspace, the Terra entity. In the Terra entity we find that several lexical threads have combined into a more complex lexical structure which is being seen for the first time. While it is not unusual for apparent patterns of internal cohesion to develop as the modelspace is being populated, these are usually illusionary and due to specific and related items being populated such that they 'seem' to be forming a pattern within the entity. Again, usually these are transitory and only appear to manifest structure due to the paupacy of the data set at the time. As most often happens, these apparent structures dissolve as more data is loaded and the entity 'fleshes' out, thus diluting the apparent structure to nothingness over the time of the modelspace population. Not this time however.
As stated, a more complex lexical structure than previously seen has developed within the Terra entity within the modelspace. It is from this lexical structure that we are taking the primary 'phrase-aspect' for the intrepretation, that is, 'Rising to Exhaustion'.
Specifically, this structure carries within it references to [ground/earth/dirt/fundament] which is [rising/lifting/upwelling/swelling/bulging/building/growing/expanding] to the point of [exhaustion/depletion/fatigue/emptiness]. The structure is cohesive and is internally self linking, (aspect to aspect) but does not reference circuitously. Rather its internal self links all terminate in another link which is external. As an example, the [exhaustion/depletion] aspect links down two levels to [carried/bearing/holding/hauling/dragging/moving] which has its attributes cross linked out of the structure over to (empty) [city/buildings/structure/village]. Futher the cross linking also goes three levels down to [barren] which is modified by (house) and contains internal aspects of [road](littered/strewn) with [debris]. And [debris] is linked back up to the primary structure as a modifier to [exhaustion/depletion]. It is as though the earth will rise up in such a way as to create conditions which are [untenable/unacceptable] such that [residents](flee/run/leave/vacate) the [city/buildings...] and the [road] conditions are so (harsh/brutal/debilitating/wearing) that those who flee (carpet) the [road] with (former) [belongings/possessions].

Further, the structure has links out into the rest of the   Terra entity such that it suggests that either the rising of the earth will   be so wide spread as to affect much of the planet, or that the rising will be   so devastating as to [hobble/curtail/remove (one leg)] the global financial   system such that the pain is distributed. These external links include references   to (deserted/abandoned) [city] is (reached/met) by [ascend(ing)/climbing. The   [core/center] of the [city] is (bright/lit) but [empty].

Along with the (bright/lit/lighted) attribute set, we find   repeated cross references to (lightning) both as attibute and as aspect. In   this structure, a compound aspect set exists in which the [lightning] (ruptures/cracks/splits/divides/penetrates)   the [crust (of the earth)] which in turn is seen to (cause/create) [lightning-streaks/sky-marks/blaze-remnants]   which will [radiate/extend/spread] from the [center/middle] of the (abandoned)[city]   and act as [guides/clues/markers] to the [center/core]. Additionally the structure   is repleat with references to smells. These are referenced as both aspects and   attributes, and contain a very full attribute set which includes (stink), (stench), (burned-metal odor), (tungsten burns the nostrils), and more curious references   typi-fied by (steel stinks dead) and [iron-rust] (stench) (fills the area)(copiously)   which in turn is seen as (driving/compelling) the [abandonment/desertion].

Usually in this work we discard numeric references as there   are so many on the net that the level of noise relative to specific numbers   usually renders them meaningless. In the normal course of interpretation we   would use oblique references such as 'many' or 'very many'. Something along   those lines. These are frequently seen in more 'primative' societies where beyond   what one can hold in the hand, the idea of numbers is less than useful. In the   case of the 'deserted city' there are some disturbing refer-ences to the number   '13 millions'. This number arises as repeated references both numerically, abstractly,   and nomatively. Aligned with that are repeated references at attribute levels   for the concept of 'millions'. So the concept coming across is that some '13   millions' would/will leave this city due to this event. Readers are cautioned NOT to take the number literally and go off hunting for cities large enough   for that many people to be able to flee. Rather it is the general sense that   a large number of people will be involved in this event, and perhaps the numbers   who will be alive to [flee] and (leave/discard/cast off/jetison) their [treasures/hordings/possessions]   will be in the millions and this will result in the [roadways] being [covered/cloaked/hidden by] a [debris] [trail/residue/remains] to the point that [animals/herds/steers]   will (not) be able to (climb through/over come).

There are several of the attribute sets which participate   in this description. These modifiers include the [earth/terra/fundament] (is/will   be) (set loose/released tension) until it [pulsates/vibrates/quivers] in a (fluid)[motion/movement]   such as [waves/surf/tides] that will result in [undulations/curvature/distortions]   (remaining/staying/perma-nent) that will (contort/alter/change) the [steps/ridges]   to (be seen/be perceived) as [waves] left in the earth. The basic idea coming   through can be interpreted to suggest

that the motion that the earth will take will leave an undulating wave-like form cascading down the [slopes/sides/steep/step] of the [hill/rise/foothill] such that from afar people will be able to percieve the [sea/ocean] (tides/rhythm) (locked/captured/frozen) in [solid earth/crust/fundament/firmament].

Further, the indications are that the area in which this will happen will be/is a gold/mineral mining area. In the process of the ground [rupture(ing)] a large deposit of minerals - gold is specifically referenced - will be (revealed) to the [sky](sight) {ie.-airplanes?}. But the cautions are that the area will be (littered/covered/trashed) with the [corpse/body] of many animals and humans, and that (breaths) taken in the place will put people at risk. The lexical structure suggests that those who would (seek/try) to [eat/comsume/chew] the (dried)[meat] of the area will be placing themselves at great risk of [disease/harm/infection] and that [danger] is apparently literally (scattered) around the [ground/earth/crust] like (broken/undone)[pearls/ornaments/jewelry]. One last note on this is that the caution extends to the [feet] being (at risk/danger) from merely (walking/strolling/hiking) in the area. Supporting this idea are repeated references to [contamination] in various forms. This attribute set containing the [contamination] warning is repeatedly cross-linked and at least one link is found at every node within this descriptive structure.

Now, this is not to suggest ANY form of man-made mischief including nuclear weapons. There are NO such references in the structure or entity at all. This is apparently all a result of 'natural' earth activity and there is nothing at all within the aspect/attribute sets which even remotely hints at human causation.

There are some lexical clues suggesting that the timing of the Rising to Exhaustion will occur in [spring]. While there are a number of references to this particular period, that is, between December 27th and December 30th, both as a period of (quiessence) and as a (breather/break/pause), once we got into the model and more fully populated the Terra entity, we find that all the references to any time period actually seem to point to spring. We find a lot of the [beauty/fragrance] of the (early spring dawn), and (new grasses/plants/growth). There are also references to (clear)[skies] in which the [seasons] are [fixed/marked] by the (passage/movement) of the [stars], [sun], and [moon]. We also find complete aspects of [budding], [birth/germination], [warming], and (new/early/fresh)[growth] (comes from/springs from) [decay] (putrified/composted/rotted) by [winter][rains].

The supporting elements of this complex lexical structure show that [transformation] (restores) [everything/universe/planet/world] to its [essence] with the [stars] (pointing) (towards/at) the [way/path] of [spring/equinox] which also further goes toward suggesting a spring event.

There are details within the structure indicating that the [toll/cost] of the event in lives will be horrific, but that some 'lucky' persons will survive. These people will [walk] from the [devestation] (clothed/covered) in [bloody][burlap/course cloth/scraps/dirty

clothing] taken from the [stores/warehouses] remaining in the [deserted][city]. The suggestion is that these people will be [forced] by circumstance to [walk/flee] the area on [foot] after having (abandoned) their [carts/carriages/cars/transportation] in the [debris] of the [city]. And that mostly the former [roads/highways/trains] will be (impassible) and will lead many to [perish/die] in (struggles/conflict) with [old life/former state]. One interpretation is that those who try to use the remnants of the city's structure such as cars will be wasting their time as [life/freedom/escape] will lie [under-foot/on-foot] on the [paths] of the [animals], which could be interpreted as cross-country.

The primary danger, after the 'event' which causes the earth to rise, taking the city with it, will come from [fumes/fumerols] both [earth] located -natural- and man-made. The suggestion is that (industrial) areas will become (holes) [letting/producing/venting/spitting] (fumes/smells/chemicals) which will (burn/incinerate) the [feathers] of the [birds], and (sear/char/crisp/melt/burn/corrode) the [fur/hair] from the [corpse(s)] of the animals such that the view from above will [not allow/cannot be determined/unknown] the (dead) to be seen as human or animal. The interpretation here is that from overflights, it will not be easy to determine what is a dead animal or a dead human as the fur and flesh will be so corroded.

The fumes issue also will affect the water in the area such that those who do walk out will have (sustained/endured) on [dew]. Further an aspect line suggests that the survivors will be seen to (lick) the [dew-drops] from the sides of the (still/unmoving/broken/abandoned) [carts/carriages] in order to (drink).

Not a good picture.

Lexically there is nothing to indicate a specific spot on earth where this 'uplifting' event will take place. We of course have dozens of geographic references arise but there is no cohesion to their placement within the Terra entity such that it would give confidence in suggesting that a particular place is the site of this event. This happens frequently as there are so many geographic references within the data that these really constitute 'noise' in our signal and mostly they are ignored. So at this time in the processing, there is no point in attempting to assign a spot for this aspect. However as the modelspace is continuing to be populated we may find that this will change during the processing.

As to those geographic references that we do see, a very notable one stands out. In this particular case, and NOT associated with the above complex structure, but merely one of the many other elements within the Terra entity, we find that California is again rising from the 'noise' level.

In this case, the aspects associated with the California specific references show that a series of (devastaing/damaging) [rains/rainfall/storms] - {ed: perhaps already started} will continue such that the [ground/earth] will (change/alter) [color/appearance] to the point that it will be (unrecognizable/unknown/not seen). Many indications for [sink-

ing] and [subsiding] exist, all of which cross-link   back to [water/rain/deluge] attribute sets. The idea of a large earthquake causing   California to 'sink into the sea' does NOT come through, but rather the whole   tone is one of being [washed/carried/born] away by [water/rain/deluge]. In this   attribute set are many references to [marsh/marshland/estuary] being (subsumed/covered)   by [sea/seawater/ocean/saltwater] such that [places] of (earthly) [seductions]   and (addictive) [pleasures] are (no longer/not/former) [visible]. The California   linked aspects show that the [land/ground/fields/earth] will (change/alter)   until it (seems as though/resembles) the [stripes/marks] of a [tiger]. These   changes - perhaps storms? - will come in (three)[waves/movements]. These [waves]   will so physically change things as to [not be believed/denied] unless actually   [seen/experienced/lived through/endured].

Again, let us note that all the references so far indicate   'rain' and not any form of tsunami to affect California. Also we must note that   while some of the specfic references to California {in previous ALTA reports}   were accurate, in the main, the level of forecast damage was NOT ACCURATE. So   while there were two distinct earthquake 'events' caught in previous ALTA processing,   we were way off in the interpretation of the damage. So there is no reason to   suppose that this intrepretation is in any way different. We may well find that   we get some specfics of the damage to be seen from the rain-storms, but likely   we are over-interpreting the potential for disaster. However, with the recent   tsunami as a counter-point, it seems that erring on the side of caution - that   is, assuming lots of damage - is indicated.

The effects of these as well as other earth-changes are   seen in other entities within this modelspace. We find that cross-links cover   many of the Terra entities aspects and show up in other entities such as the   Populace entity where the effects of the earth-changes will be seen as the cause   of a major perception shift within the mind-set of the populace of the planet.

Other areas of the planet will also be affected by earth-changes.   Again, specifically relating to water, there appears to be a double threat described   which will affect [most of/majority] of people on the globe. The suggestion   from the data is that the [lakes/resevoirs/seat-source(of springs/streams/rivers)]   in the [Himalaya's/Andes/Other High Mountain Area]will (give way/release) their   [holdings/reserves] causing the (downstream/downhill) areas to be (washed/carried)   to the [ocean/sea] . Not only will the devestation be severe, but afterward,   the [lack of/drought] will bring widespread [migrations/movement/relocations]   of both humans and animals such that the [faces] of the [peoples] (mingle) in   [strange/foreign] [places].

The lexical structures have geographic references to all   the Himalayan countries as well as many references indicative of the mountain   range including meta references to the languages spoken in the region. We find   that the references are mostly immediate to mid-term distancers so one could   say that the obvious interpretation is for some time period from 1 to 4 months.   The internal emotive values for duration-of-impact show very high on the scale   which in the past has been successfully interpreted to mean years. Under the   circumstances it would make sense to follow that interpretation again and postulate   that earth movement will [rupture/break/remove/separate/

ALTA IR - January 6, 2005 - Part 2 - Section A

NOTE: The data set processed for Part 2 is POST tsunami, and   therefore, earth focused with negative emotive sums is to be expected.

NOTE: while it is expected that tsunami language will appear   in our data sets the above references are forward looking. They have future-impact   value sums. However, we have no way to judge, at this time, just what level   of dominance the recent tsunami will have on our data sets other than to say   it will be significant. This data set is the first to be run which includes   post-tsunami gathering. This data set must be assumed to be dominated by that   emotional theme, and indeed is very coloring of the modelspace. Nonetheless,   we have made adjustments to the model to lower the visibility of the immediate   impact lexical sets so as to try to extract those which would be meaningful   going forward. No way of knowing if this effort will be successful.

Part 2 - Terra - Nature: Clinging to Radiance, Populace - Water,   Money, and China-Electrical Storm, Financial System - Rot Exposed

Asymmetric Language Trend Analysis Intelligence Report
  Changes in language precede changes in behavior.

Data set distilled from 25.8 million reads.

Terra - Nature: Clinging to Radiance
We find, not at all unexpectedly following the Sumatra earthquake   and Indian Ocean tsunami, that a great many earth related lexical sets are emerging   within the data. In point of fact, the modelspace is dominated by greater than   48 per cent at this stage of the processing by the Terra entity and its interconnected,   sub-entities, or unions with other entities. This is very atypical. Usually   dominant entities might be Populace or BushCo or other 'high emotive sum' plus   'high change content' sub-jects. And even so, these rarely exceed 18 per cent   of the total modelspace. In this current process-ing the Terra entity not only   dominates, it consumes most of the space and is actually subsuming many of the   the other entities in toto or to some significant percentage.
In the developing Terra entity we also find a number of   direct links to [space] themed lexical sets. The use of [space] in this form   is defined as solar-system inclusive, but not limited. Usually there is a near-space,   or close-to-earth emotional component to this usage. In previous interpretations, [space] that was long distant had a 'close-to-earth' connection in that the   actual focus of the lexical set was either a probe or reports from or about   deep space as a result of some change here on earth. The appearance of the [space]   themed lexical sets being subsumed by the Terra entity may indicate that events   here-on-earth are about to be influenced by some development in [space]. If   so, we find that something [bright] is going to [rise](twice/again). This may   refer to visible comets, or solar activity. No specific information arises from   the set other than its appearance. This goes more to suggesting that whatever   arises (twice) and is [bright] is more of a 'marker' than a causative agent. The only other lexical clues go toward (illumination/lighting/shining)   the [four/4][quarters] of the [world/planet/terra]. However, references to [mars]   and the other near-sun planets suggest that this [illumination] may not be earth   limited. The last clue we receive is that the 'cow' or constellation of Tarus   is [prominent].
Now, while the [space] connections are providing less clues,   we do find a number of lexical sets within the Terra entity which are more illustrative.   In one case we find a huge number of sets, nearly 2978 that relate to the [sun]   in one or more ways. With such a large body of references, it is difficult to   choose for significance/meaningfull-ness. However, in general the references   are not competing views or lexical sets, rather they seem to 'cluster' around   the idea of the [sun] (reflecting) in the [water]. There are many references   to [boats] and uniquely those forms [proa] which are specific to the Pacific   Ocean, but the lexical sets are both very broad and very deep. These, at first   glance seem to indicate a region that one might say extends from the international   dateline, more or less, in the Pacific Ocean, all the way over to the Mid-Atlantic   ridge. Now note the curiosity that arises in that our references START in the   Pacific and run to the East. This of course is contrary to the existent path   of the [sun]. This left-to-right-ness jumps right out of the lexical structures.   In the interpretation, both Igor and I were instantly aware of this 'anomaly'.
We also find many references to the [material] (descends)   and (what was/once was/postulate)

[etherial] is seen as (rising). Does this refer to rising land? Could be, as one interpretation could be that lands currently under the water could be viewed as being [etherial]. Other sets going to this idea suggest that the [risen/uplifted] area has (no/none/deprived of) [wheat], [trees], [grasses/pastures]. Additionally this area is seen as [gassing/outgassing/releasing] for some [years/time] until the [vents/fumerols] are [filled/completed] with [ashes].

Apparently one of the first indicators of the (rising) will be a large area of [water] that (becomes)[on fire/engulfed in flame/flame hidden]. This is to be followed by [water] that (boils) but not due to heat, rather to the release of [gas] and the (expulsion) of [mud/silt/fine material].

Whether related to or merely conjunctive with the (rising) will be a period in which the [sun] specifically seen as (setting), which of course is often the best metaphor for the West, also brings with it a (groaning/growling) [noise/sound] from Terra. This may relate to angular momentum affecting earth-plate movements which have been known to emit sound during earthquakes. The [old man] in the [ground] will (growl/groan) [long after/long following/period beyond] the (setting)[sun] such that [sleep] will not be easy or possible until near [dawn]. This suggests an obvious interpretation of a 'long night of the soul' as the planet groans significantly, keeping the local humans awake through the night.

The emotive sums available with these lexical sets come out as very high values but with negative emotive connections. As we use a scale evenly balanced at zero being neutral, our sums can reach high values, above or below our neutral point. In this case we are approaching a theoretical maximum of a minus 1. Since the scale is logarithmic and limited to unity on either side of zero, this is a very strong reading indeed. Once the sums rise to over .9, further distinctions appear meaningless within the context of the emotions being registered. Good at .9 or 1 is good, bad at -.9 or -1 is bad.

The act of (rising) is seen as creating some problems for humans. There appears to be suggestions that [feet] (alone/only) will [suffice/satisfy] as though to say that other forms of transportation will be affected.

The image that best describes the 'tone' of the lexical sets emerging is 'a table lifted on two legs'. That is, a [table/tabula/flats/plains/surface] which is [lifted/tilted/raised/uplifted] on two [legs] such that an incline exists from [west] to [east]. How much incline? There are no clues offered. This view would support a small lift of some land out in the Pacific along with an imperceptible rising of the western edge of North America, or might be indicative of a general lifting event that perhaps could be noticed by humans.

To this latter, we do find a number of references toward aspects/attributes sets which go to the idea of [wrapping][things of value/treasures/sentimental items] to (protect against/prevent) [damage/destruction] (when/inevitability of) they (fall/drop/topple over). There are many such references all in the same vein of [preparations] (undertaken) to the extent that even the Populace entity has the same, and cross-linked aspects. This may be suggesting that perhaps warnings of potential shaking go out to the point that large groups of people take preparations for some immediate potential, and that this is widely reported.

Geographically, this appears to be North America continent focused, but we must note that the range of lexical clues is such that North America predominates by only 8% over South America references. In either case, the [full/complete/total][extent/range/run/all/omni] of the [coast/coastal range/coastal area] is involved. The [coast] references are also magnified by repeated references to [bays], [delta],[estuaries] and other, lexically fractal references to [coast] emptying bodies of water.

This period is also characterized by a major aspect cluster {ed: where many aspects, each of which appears as an attribute in the other aspects in the set, all cluster about the same emotive context + duration + impact}. This major aspect cluster can be defined as [danger] from (breaking/broken/

weakening)   [fundament/beams/joists/pillars/supports]. This aspect cluster contains aspects   referencing (broken) [support] in both the material, and the emotional {ed: such as counseling} areas. However the material predominates by over 80 % and   the emotional all have long-range, long-term, emotive impact values as attributes   below an aspect containing a positive 'distancing value'. This suggests that,   relative to the event being prepared for, the emotional aspects are further   out into the future, while the preparations are mostly in the immediate and   towards physical things, rather than emotional needs.

Curiously, along with this cluster, and running the same   length within the entity, we find references to [heavy] (winds) which (strike)   [weakened] [roof/roofbeam/truss]. The [strength] of the [beams/ wood/supports]   are (sagging/bowing/waning/weakening) which finally give way under the impact of the [heavy] (winds). Now the curious part of this is that the [heavy] aspect   is specifically filled with attributes going to, and containing, [gravity].   Usually one would interpret [heavy] (winds) to be a large scale wind storm with   winds of some force, say approaching hurricane strength. In this instance, and   unlike our storm words seen before the hurricanes hit Florida this past year,   we see words much more to the idea of 'gravity' and very few going towards 'force'.   This is so anomalous as warrant attention. It may be a new way for strong winds   to be indicated, but still, it is very odd that words usually seen indicating   speed are almost totally lacking. This might be indicative of heavy winds in   the form of air that is very saturated with moisture. A stretch, yes, but the   lack of speed indicating words is bothersome.

Along with this aspect cluster, there are several which   'mirror' or 'fractally mirror' the central (rising) theme on a more local to   the [coast] aspects. These references are also to [rising], and [roofs/eaves] (rise) in the [clouds] of [dust]. Again a curiosity emerges in that there are   repeated references to buildings, but only from the floors up. Conspicuous by   their absence are words relating to foundations.

The 'rising roofs' are also accompanied by references to   (rising)[streams] and (rising) [tide]. In the case of the former, the [streams]   are repeatedly linked to attribute sets which include the idea of (wading/crossing/emersion)   and (walking/movement). There are emotive value bespoke words along with this   set which include (courage) and (fortitude) both as 'active' aspects fully populated by supportive attribute sets. One interpretation is perhaps an admonishment   to 'courage when faced with rising waters' sort of emotional 'stiffening' that   is coming through. It would fit the lexical set in general and counters the   other side of the aspect set which includes some dire image aspects such as [head](disappears) (under) (rising) [stream]. Also seen is [tide] (rising) to   (extreme) (without/sans/ lacking) (hindrance/resistance). Both of which would   indeed demand courage.

NOTE: while it is expected that tsunami language   will appear in our data sets the above references are forward looking. They   have future-impact value sums. However, we have no way to judge, at this time,   just what level of dominance the recent tsunami will have on our data sets other   than to say it will be significant. This data set is the first to be run which includes post-tsunami gathering. This data set must be assumed to be dominated   by that emotional theme, and indeed is very coloring of the modelspace. Nonetheless,   we have made adjustments to the model to lower the visibility of the immediate   impact lexical sets so as to try to extract those which would be meaningful   going forward. No way of knowing if this effort will be successful.

We'll leave the Terra entity here, as we have several more   to drill into, time is short, and any further words on this subject will either   entirely miss the mark, having been influenced by the emotive impact of the   tsunami, or will be redundant to developing circumstance.

Populace - Water, Money, and   China-Electrical Storm

In examining our Populace entity, we note that it is running the highest emotive value sums on average ever seen. This again gives one pause in placing much value on interpretations. However, it is worth noting that the Populace entity has a lexical arm whose primary aspect is [california] and in which we find that there are opposing arms of [confusion/chaos] and [drawing together/clinging/massing/uniting]. Both of these aspects contain attribute sets which could be said to be startlingly similar without being replicates. This implies that perhaps we are seeing two, opposite views of the same set of circumstances. Or it could be that a single set of circumstance, such as a large scale earthquake, creates two distinct reaction-sets, depending on geography within the event.

We find as supporting lexical threads, the sub-aspects of [indecision] and [dither/waver/quaver/shake/quiver] within the [confusion/chaos] primary aspect. Again noting the exceptionally high emotive values, which in the ordinary course of things would be taken as a large emotive shift appearing, we have to consider that the scale will be small, and is merely magnified by the emotions emerging from the tsunami affected data set. However, under this [california] specific sub-set, we find aspects/attributes as in (floods) of [tears], (wailing) on [mountaintops/peaks], and (mourning) in [desert].

Co-incidently, opposite in the [drawing together] thread, we find aspects/attributes such as (remorse/regret) with emotive sums placing the value in the past, as though events force the [shedding] of [bags/goods/possessions] which (hamper) (movement forward/progress). The [crowds/groups/gathering/mobs] are modified by (walk) (unsteadily) [forward/upward/progress] (toward/seeking) [mountaintops/peaks]. This might be more of a description of an emotional nature of people 'picking themselves up, and going forward' rather than a descriptor of an actual event. These days though, who can tell? Large earthquakes may be making an appearance globally.

Other than a general (early/soon) [spring] aspect here and there within the sets, we have no indication of any specific time frame. Of course, the interpretation must take into account the various planetary line-ups will will come into place over the next few months in the period prior to the equinox, so it is possible that quakes or 'rising' land would appear by 'spring', if these alignments have earth-plate effects. Specifically, we do note that January 9th through the 12th will see such an alignment of planetary bodies.

Again, with every emotive value set in all entities running to the maximum of the scales, it is very difficult to seek for 'differences in degree' which allow for assigning greater meaning ranges, and values to the sets being seen. It is sort of like looking at all the control panels on a submarine or nuclear reactor when they are all red-lined. At that point, at least in trying to deduce what is going on, virtually anything would seem likely, given that somewhere there is a needle bent over to support that idea. At this stage, luck, born of years of developing skills, may mean more than specific data indicators. In the case of the control panel, you know that at least one of the meters is correct, and is telling you the root of the problem, but you also know that almost all the other meters are lying to you and merely reflect a cascading problem-set. We face that now. There is no way to predict how long into the future such impacts may continue relative to our data gathering.

There is, as expected, a very large segment of the Populace entity devoted to [water]. This was one of the areas that we tuned within the matching-lexicon prior to setting off the spyder to collect the reads. The [water] component does focus on very negative level emotive values, but also contains a small, uplifting, or plosive level emotive thread. This having been noted, we also need to consider that the [water] dominant component of the Populace entity, with its cross-links back to the Terra entity, clearly shows long-duration and high-impact levels remaining. As of this point, the [water] aspect is showing a greater than 3 year period for [danger], and [abysmal] (threats).

The indication is that while the [cup] (has had) its [lip](overflowed), the [remainder] (will yet/shall be/in the future will) (froth/foam/boil) (out of/over/overcome/to exceed). Further, within this

thread, we find that a situation will exist where it will become normal to (pass/transfer/hand over)[goods/material/supplies] through the [second story/upper floors/highest levels] of the [house/home/dwelling/shelter].

The descriptors that one finds within the [water] component, including its cross links back to the Terra entity, show a preponderance of references for [rainwater/rain] over [seawater/tides], however both contain similar constructs such as (difficult/impossible to) [overcome/resist], or (content) to (float/rise) on (unstoppable) [rainwater]. The sense that comes across is very much one of counting one's blessings as in 'may be up to my neck in water, but at least not drown' which phrase is actually constructed from a single lexical attribute set hanging off [rainwater][stream/creek/river]. Also hanging off the [rainwater] aspect set, we find numerous references to [ravine/scar/rift] with the indications being that long [dry beds] will soon be carrying a considerable amount of water. Again, while expected to arise within the data set, we still find that these references are future looking, as though to be expected.

Also within the Populace entity we find 'echoes' of a large-scale mood shift, for lack of a better way of stating it. The aspects for such things as [money] or [work/employment] contain hundreds of new aspects and attribute sets. Unlike previous changes such as those that developed between 1997 and 2000, we now find a new 'philosophical' base appearing within the [work] aspect of the Populace entity. While this could be an emotive 'slide' from the tsunami, some of the Populace data predates that event and still contains many of the new aspects. These aspects are clustered about a (forced/compelled) [resignation/acceptance]. The interpretation, given the many attribute sets is one of a 'grudging acceptance' of circumstance as relates to things 'financial/fiscal/economic' at a personal level. This lexical arm is distinctly shaded (pun intended) with references to the 'gray' or 'shadow' economy. The weighting of this aspect shows that it alone is responsible for nearly 30% of the whole Populace-personal-economic-emotive-sum metric. That is to say, the 'mood' expressed within the Populace entity is now weighted almost one third by references to/from people having to survive in 'black market' activities. Even in those reads in which the emotive sum was positive, there were still values representing the context of risk or of being [outside] the system. The many attribute sets tend to read like Britain in the 1950's when everyone was apparently deriving at least part of their income 'on the fiddle' or extra-legally. This level of emotive sum weighting has been rising over the last year, but within this processing alone has grown 9%, well over its usual rise of just over 2%. This suggests that a large number of people still with computer access have been forced 'out of the system' by circumstances and that this group is grudgingly, albeit rapidly, changing its perception of the future. The emotive tonal aspect/attribute seeming to best sum the thread would be [grim][determination/steadfastness/resolve]. It may be that this emotive 'turn' is signaling the large scale death of the 'american dream'.

Again, it is worth noting that the Populace entity often pre-sages the appearance of MSM {ed: main stream media} news or 'themes'. It may be that our Populace entity will be one of the first expressions of a new and more grim view of reality.

In light of the previous ALTA reports from 2004 in which a large 'cognitive dissonance' was noticed during development, we could say that there appears to be a developing of a 'physical-personal-economic dissonance' in which western society seems to be (fracturing) into those who are participating or hope to, and those who have abandoned the effort. There are also three data sets of completely populated aspects/attribute sets which connect some aspects of [work/employment/job] back to the Terra entity, the 'illumination' and some subsequent event which will apparently cause a large (swelling/engorgement/enlargement/increase/ballooning) in the [group/cohort/collective/mass] of the Populace who will see themselves as being more or less permanently excluded. This 'permanence' is a time versus duration-impact ratio which resolves to a greater-than or lesser-than 10

years.   Any perception with a decade long duration is considered as one-half generational   (20 years average breeding age for western generations) and therefore is considered   permanent in that the 'tone' of the times will be passed inter-generationally.

The Populace entity now includes a component specifically   composed of and representing China/Chinese interests. These extracts are, necessarily,   from those sites allowed by official edict of the Chinese government. While   the government will also enforce a certain uniformity of expression within the   approved collective thought, there are nonetheless, some emotive indicators   coming through. A linguistic note on processing. Chinese is an emotive language   where emotive values can be extracted from tonality of expression. This means,   that unlike english, emotive values are expressly encoded in the various ideograms   from which the 10thousand + character language is composed. Even with romanized   versions, some emotive exclusions forced by the translation software, expose   the emotive values. We are attempting a new form of emotive summing for Chinese   as well as backing it up with anglicized lexical translations which is a more   or less normal approach.

From this first Populace entity Chinese extract we find   a very curious, and 'echoing' reference to an [electrical] (storm/occurrence/cloud/happenstance).   Similar in nature to the East Coast power outage incident that the ALTA reports   seemed to pre-say, we are seeing lexical structures for China which eerily echo   that sort of incident. Specifically we note that the [land/expanse/ground/places] [north] of the [yellow/yalu] (river) and (extending/running) to the [far west/western   edge/western boundary] of the [winter] [desert/sands/deprived], and as far north   as the [boundary] presumably of China, will experience an [electrical] event   being interpreted here as a storm, resulting in a large scale power system failure.   Such that [scrambles/flees/races] for [fuel/power] will be felt nation-wide.   The (compassion/forbearance) of the [south] will provide some level of relief   but only for those along the river. It would appear that this event will come   about through a [storm] that is [towering] to the top of the sky and is [electrical/electrified/forced]   in nature. There are repeated links back to the 'illumination' within the Terra   entity which perhaps can be safely interpreted as being time-related to that   event, which would make sense. A large scale rising of only one inch in height   in any area would release giant amounts of energy which could form [sky](encompassing/filling/covering)   electrical storms. China has even as recently as this past fall seen 30thousand meter high cloud formations. This event, the power outage is seen as having   long term ramifications for China, in that the emotive value sums are forward   reaching for about 3 years, and are seen as (pressuring) the [coast] and the   [south] to (unavoidable)[excess/extreme].

Further cross links within the Populace entity go back to   the Terra entity and specifically reference the [north] and [west] of North   America. Within the Populace side of the links, the aspects go to those who   will apparently find some serious (suffering/exposure/travail) this winter due   to [storms/lashings]. Again, with reference for the [north], [northeast], [northwest],   and [west] there exists the lexical data sets last interpreted as [shortage]   . The same set that appeared for the pharmaceutical industry last fall, and   pre-sayed the withdrawal of the drugs from the market, and the indications we   had for a [shortage] of anti-flu shots, exists now. In this case, the Populace   entity contains this structure in reference to [staples/main/salt/wheat/basics/fundamentals].   It would appear that [storms/weather] will impose [shortage/rationing/metering]   for at least a short term duration. Our emotive values extend out 3 months within   this aspect/attribute set. However, this whole structure is a sub-set of a larger   aspect within the Populace entity which has emotive sums going out 6 months   to a year. The indications is for some form of short term crisis with longer term repercussions affecting supplies or basic fundamentals for some one third   of the population of the USofA. Specifically we find the data sets for 'many'   and 'most' applied to large areas of the continent. It does appear that some   of this spills over to affect Canada north of the Great Lakes,

and the Maritimes, as well as the B.C. coastal regions. There are components here indicating power loss, as is being seen concurrent with our data gathering, specifically within the central states area, however, the shortages expressed within our data are indicated as being caused specifically by [weather/climate] extremes which impose [travel/movement/conveyance] (bans/restrictions/denial). Further, power impacts as expressed as a sub-component within this structure compose less than one-quarter of the 'aggravation' factors within the emotive sums. This is to say that when seen in hind-sight, it won't be the power outages that are 'remembered', but rather, as stated, the [shortages] of basics.

As a component of the Populace entity, which we need to remind ourselves is almost subsumed in cross links back to the Terra entity, we also note a general rise in specific place names being associated with negative or high-negative emotion values focused on weather and climate. Especially following the tsunami, this is not unexpected, however the scale of the rise has been continuing more or less apace since 2002. In this run we do observe a very large spike of bespoke appearances of locations in reference to both weather and climate. Neither has any positive component that survives our processing.

As in the note above about the USofA north, and west, we find specific references clustering about northern Africa, in the desert regions south of Tunis, and in South America, along the south western coast, as well as for specific areas of the mountains ringing Bolivia. In both cases, the expectations is for (unseasonable/out of place/out of time) (flooding). The associations within the Terra entity go back to the [rainwater] data structures previously described.

Not withstanding the obvious linguistic links, the South America containing data sets within the Populace entity also share links back to the specific data sets referencing [california] within the Terra entity.

Financial 'System' - Putrefaction, Draining-out-the-bog

Again, seriously subsumed by the Terra entity, the entity chosen to represent the Financial System is not showing any good signs. We find repeated references to [weather] as a bespoke or 'blamed' element, but in the lexical descriptors, there are numerous and pointed words describing [rot], and [rot](exposed), and [worm-eaten/corroded][beams/wood/timbers/supports]. Further and further on into the entity we still see down over 9 levels of sub-aspects, that the [putrefaction] of the [arms/limbs] has (reached/obtained/breached) the [core/body]. Further references are to [body][parts] too numerous to [be lifted/picked up/recovered] and that this financial rot has finally (drained/emptied) the [bog/marsh/lake] into the [sea] which further (exposes) the [wood] as [snags/danger/risks/problems]. The [problems] created by this exposure are further (exasiration) for the [subordinates/crews/staff] who are tasked with [mud] (covering). There are cross links back to the Populace entity relative to the [shortages] and that these two, that is, the [weather] directly, and the [shortages] resulting from the weather combine to expose the [weakness/fragility] of the financial system. Specifically in this case, by Financial System we are more properly referencing the 'financial industry' of banks and money transaction and providing organizations. We do see some of the 'market' oriented lexical structures here also involved within the 'rot' being exposed, but it would appear that the 'currency' component, and the ability to 'trade' paper for goods, goes bad, and the rot is exposed at the core in fairly short order, which initiates an impact on the other, more outer levels of the financial industry.

This [putrefaction] of the Financial System entity has cross links back to the Populace entity and at a primary link level contains some data sets with [alchemic] and [natural process/chemistry] and [transformation] all as aspects. Each of these has attribute sets which cross link the Populace entity back to the Financial System entity on words of a similar nature and emotive value. It would appear to be suggesting that at some level this will be viewed as a natural process of decay, and

transformation, even in the midst of the (upheaval/uprising/revolution/rebellion) that ensues. Not that this in any way is comforting.

A general interpretation would have some weather related shortage-causing event create an exposure of existing financial system weakness leading to a rapid, and global shedding of confidence in the USofA dollar {as per Part 1}.

As a result of the weather exposure of dollar-rot, a 'co-habiting' economy emerges within the USofA. While this is a positive event, it arises from largely overwhelming or dominating, negative influences. The descriptors found within the Financial System include [exhaustion], [oppression], as primary aspects. These see the [demand/imposition] for (sacrifice) being [requested/suggested] but also, by cross-link from Populace entity, [rejected] with (certainty/intent). So apparently appeals by [ministers] from [positions] seen as [warm] and [priviledged] are not going to be heeded during the weather crisis when so many are seen as suffering [beyond/over/above] [endurance].

A note on timing:

Occassionally we find data sets emerging in which the aspect is a date. While rare this is not unknown. Usually we end up with date ranges, but sometimes specific days. In Part 2 of this run, we note that there are four specific dates emerging. These are the 23rd, the 25th and the 30th of January and the first of February.

At this point in the processing these dates are mostly associated with word sets which are financial or fiscal or market oriented. While much more processing is underway, and the nature of the word sets associated with these dates will likely change through additional words being placed within the sets, we still get the following 'clusters of words' as aspect/attribute chains around these dates as detailed below.

January 23 - [withdrawal/retreat/turning back], and [dangers](appear)

January 25 - [fear] of (reckless)[behavior],[fear] of [uncontrollable](violence) (appears)

January 30 - [doubt] and [exhaustion], [pain] and [suffering]

February 1 - [center] is (lost), [balance] [broken], [equilibrium] at [risk], [goal](missed)

As the BushCo 'great brains' set their Waterloo date so firmly in mental stone with the Iraq elections for January 30th, a reasonable interpretation of these date clusters, especially focused on the markets/financial/fiscal relms, would be that things go very badly indeed, and that while the 23rd and 30th are both sundays, it would seem the first of February, a Tuesday might see the end result of the Iraqi election on the USofA financial industry. BushCo has so linked their credibility to the Iraqi elections, and things appear to be deteriorating so steadily as time progresses, that it would appear reasonable to suggest that BushCo is unable to successfully pull off even a sham election in Iraq, and that realization hits the populace on January 30th, and the big impact hits the USofA markets on February 1. If there is a USofA treasury 'auction' on February 1, it would appear likely to be a big fizzle, based on the lexical sets emerging.

This update is for those who have financial assets at risk in paper form in USofA markets. It also appears in Part 2, due to be posted by January 9, 2005.

META-DATA

UFO reports/references are way up in this data set. Such a rise that it almost becomes a complete entity. The references in non-UFO specific sites are up 117% over our ambient base-line in toto. For non-roman-alphabet languages, reports/references are up a whopping 685% over base-line. And as may be expected MSM is also running a larger number of UFO references, though these have failed to keep pace with only a 34% increase over base-line.

Chemtrail reports/references are up a huge amount at 19,000 % in non-aberant-focus boards. These would include gardening fora, or sewing, or investing, all but science/oddities related.

Dream references/descriptions at a personal level, first-person reporting, on non-dream, non-visionary, non-meta-physical boards are up over 2300 % so far in this run. Further, dream refer-

ALTA IR - January 9, 2005 - Part 2 - Section B

NOTE: The data set processed for Part 2 is POST tsunami, and   therefore, earth focused with negative emotive sums is to be expected.

NOTE: while it is expected that tsunami language will appear   in our data sets the above references are forward looking. They have future-impact   value sums. However, we have no way to judge, at this time, just what level   of dominance the recent tsunami will have on our data sets other than to say   it will be significant. This data set is the first to be run which includes   post-tsunami gathering. This data set must be assumed to be dominated by that   emotional theme, and indeed is very color-ing of the modelspace. Nonetheless,   we have made adjustments to the model to lower the visibility of the immediate   impact lexical sets so as to try to extract those which would be meaningful   going forward. No way of knowing if this effort will be successful.

Part 2 - Summation - Expected Blending,Change Agent - Earth Changes, BushCo, Earthquakes - all kinds

Asymmetric Language Trend Analysis Intelligence Report
  Changes in language precede changes in behavior.
  By Tenax SE for HalfPastHuman.com

Note this report is offered for entertainment value only. Any resemblance   between the events portrayed in this report and any developing reality is purely   co-incidental and in no manner repre-sents foreknowledge on the part of the authors   of this report.

Note that this information is derived from humans expressing themselves   on the internet. As such, human emotional values and the words used to express   them are being sampled and interpreted here, NOT THE FUTURE. Any resemblance   between this report and future developments is en-tirely in the mind of the perceiver   and does not exist in reality. The Authors cannot be held liable for accuracy   of lack thereof in this report. Authors cannot be held liable for human interpretation   of this report nor any action any human takes as a result of this report. Any   human foolish enough to alter their behavior based on this entertainment-only   analysis demonstrates themselves incapable of rational appreciation of reality,   and the authors are explicitly held harmless and blameless for any and all such   mental aberrations on the part of the reader.

01.01.2005 Summation - Expected   Blending,Change Agent - Earth Changes, BushCo, Earthquakes - all kinds

Note: Entities are identified by a blue   typeface. Aspect words are enclosed in square brackets []. Attribute words/phrases   are within parentheses (). Interpretive editorial comments are preceded by an   asterisk *.

Data set distilled from 25.8 million reads.

Summation - Expected Blending
As should be expected and predicted, and as was noted in   Section A of Part 2 of this report, we find a dominance of all areas by emotive   ripples from the tsunami. Further, in a predictable way, all other entities   are flavored by this event.

As an example, to seek for any fiscal or financial level data within modelspace now only takes 2 levels of connection to return to a Terra entity aspect or attribute set. In previous runs we might take 20 levels to reach a cross connected aspect or attribute set. Now, all entities have some level of cross connect back to the Terra entity within 3 or 4 levels, and usually only 2. That is to say, that primary aspects are containing cross-linked secondarys in almost all entities. This does give interpretation a very different challenge this time.

We could, for instance, choose to ignore all Terra entity cross links in order to 'clean the data' of the impact. However, given that a 9.2 earthquake moved over 1000 miles of sub-marine fault line by over 500 feet, and created land surface altering waves which killed over 150 thousand people and placed over 2 million at risk, perhaps it is not wise to ignore the potential for further earth related circumstances.

So, given this set of impacts on this report, a series of cross-linked data sets are going to be summed here, mostly absent their entity ownership. That is we find a number of intriguing cross-linked data sets that can or could be interpreted pretty much on their own, and might, in a more normal run, be seen so. In this case, as these structures are complete, and are anchored in various entities, but are centered in the Terra entity, we may find that this is the most meaningful level of 'signal' to rise from the current 'noise' levels.

First up there is a structure containing aspect descriptors for a [city] which will (slide backward/fall back/drift back/roll back) into the [river][mud]. Specifically, while there are many references to the river and river bank, there are relatively few references to the water in the river, and these are outnumbered 20 to 1 by references to the [mud] of the [riverbank]. This could be taken as a local descriptive clue as perhaps there are rivers whose defining characteristic is not the river but the mud. The structure here has complete descriptor sets showing the [city] as having been constructed of this mud as well as local, river based gravel. The descriptor set is overwhelmingly shaded with [brown], and [dark][brown][bricks/stucco]. Apparently what is being described here is a [city] of some size which will slide back into the mud from which it rises. There are not very many indications for either speed, or loss of life in this event, so perhaps it is either going to be so slow as to be able to support an evacuation, or perhaps this is metaphoric language for a city or power structure about to be sucked out of sight in scandal. The indications are for a [finality/completion/stoppage] as a result of the [mud] incident/event. The data set is heavily weighted with [non-recoverable/ unavoidable/unstoppable] modifiers and descriptors for (observation/seeing/watching) the (slide) into the [mud/mudflats] which end up (covering/masking/hiding) the [city] under a [plain/tabula/ expanse] of (dry/dried/evaporated) [mud] such that [wheels] are seen (rolling) on the [spires] of [buildings/structures/temples] of [power].

Change Agent - Earth Changes

As might be expected, the emotive values of the general churn of words on the internet went up significantly as a result of the tsunami.

Also we note that a 'coin' effect is manifesting relative to the idea of the 'causative agent' for the tsunami. On one side of the 'coin' effect are those who are seeking a cause for the recent quake/ tsunami, and are coming across the various earth-changes memes, and trying these on as possible 'fits' for events as they are occurring. The other side of the coin are those to whom the reality of a causative Change Agent already exists, and they are merely folding in this most recent of earth-changes into their perceptual filters. Both, however, use the same aspect and attribute sets, albeit, with the substitutions of verbal identifiers. So beyond the primary, motivating factors, the language is the same, though it does not reflect the same view of 'reality'. There are those to whom the quake/tsunami represent just the latest, most visible manifestation of Planet X pulling in closer to earth, and there are those for whom the quake/tsunami represents some BIG changes, and perhaps

they do validate the Planet X theories?   So, same language, different emphasis. Again, the tsunami is being 'blamed'   for and on any number of different ideas from gamma ray bursts, to unexplained energy types, to too many foreigners in Saudi Arabia.

In examining the 'coin' effect, it is probably best to ignore   the emotional issues surrounding the 'its my truth' arguments and see just what   lexical clues are hanging about. This is where it gets a bit more interesting   in that we find an almost complete agreement, lexically, that the recent quake/ tsunami   is *not* merely aberrant. Nor, as most of the teevee 'newsreaders' would have   it, "not likely to occur again for decades". Rather, the lexical clues   would suggest anything but that view. We find, as a cross-linked structure hanging between the   Terra entity, and the Populace entity, the idea that (searching) for [solid   ground] (along/on/near) *any* [coast] (will prove) [dangerous]. And, attached   to the [coast] as an aspect, we find an attribute set which indicates that [feet]   are for [walking] [inward/to center]. Hanging of the [walking] as an aspect,   we find an attribute set which goes toward [walking] to [rocks/dry refugee/high   land] (locates/finds/discovers) [food/ sustenance/sustaining/fundaments] in (sufficient/as   needed) [quantities] for [eight/8] [days] (eating). Off of (eating) as an aspect   we find another level of attribute sets which go toward [eating] (not)(producing)   (own/singular/their/possessive) [food] means [walking] (over/around/through) [obstacles] of [mud/soil/ground](broken/shattered/shards/bits/pieces) [upward].

And hanging off [obstacles] as an aspect, there is an attribute   chain for [trees](provide) [refugee/ place/safety/resting] for (a short time/momentarily)   [halfway/midway] (up) the [mountain], but that (obstacles) are (passed/left   behind) (shortly) on the way up the [hill]. Once the [trees/branches] are (breached/opened/broken/unsealed),   the lexical thread indicates that the [top] of the [hill/mountain/ ridge] (provides)   [home/house/shelter] for the [three/3] [years] that it will take.

Without regard for what is seen as the 'cause' of the changes   occurring here on earth, the recent tsunami has left such an impression that   a large number of otherwise un-interested humans are now considering or are   changing their world-view. Mainly to accommodate this 'unprecedented' event, these changes are allowing for an opening in other-wise closed minds. Our data   set is expressing a great deal of 'wonderment' and 'confusion' and what we term,   idea-thrashing. The thrashing is what takes place in various fora where the   participant attempt to reach a consensus of opinion/view which will facilitate   the continuance of the area of commonality. Or not. There are several of our usual monitoring spots currently undergoing thrashing that may yet result in   large scale changes of behavior, both on, and off the net.

BushCo

Again, it is not possible to examine any of the entities   within modelspace absent the effect of the tsunami. The same holds true for   all the political entities which tend to arise within or linked to, the Populace   entity. The case with the BushCo entity is the same. We can note that a smallish   level of the lexicon would indicate that some see the recent tsunami as a [potential/possibility]   for (redemp- tion) for BushCo in the eyes of the world. However, this runs less   than 8 per cent of the total lexical mass, with the most lexical mass hanging   off of [blood/bloody] and relating Iraq.

To this lexical base we find repeated references to [disintegrating]   and [disintegration] of [union], and one can but hope that this applies to Iraq   and not BushLand.

Furthering the idea of [disintegration] of [union] we find   aspects/attributes which go to [union] (dissipated) in (vain glorious/glorified   delusions/fantasy of power) in (short time/instant).

As well as the [disintegration] of [union] the BushCo entity   also holds threads that go back to [food] which is cross-linked back into the   Terra entity. These cross links hold that [tension] (re- leases) as [rain/rainshowers/rainstorms/flood]   which (raise) [waters] (over) [higher level/extreme extent] and the [food] is   destroyed. This in turn leads to (irrational/fantasy) [demands] which are (repeated)   [three/3] times [in one night] which leads to [destruction] of [credibility/words/speech/

veracity] and the (removal/loss) of [respect]. This 'loss of respect' is a complex aspect/attribute thread of its own, that contains links down four additional levels which go back to [blood] on the primary aspect level of BushCo. In this attribute set, the [blood] is seen specifically as [bloody][hands] and the response of BushCo to (proclamations) of [bloody][hands] is seen as being a [reversion/re-saying/restating] of [previous] [accomplishments].

Now a curious section of the lexical thread above goes to a cross link back to the Populace entity, again, subservient to the Terra entity, and mixed up within the lexical threads descriptive of all kinds of earth-changes-nasties, but nonetheless, the lower level cross link from BushCo goes back to a lexical arm of Populace which has a primary aspect of [hiding]. This primary aspect is further amplified by attribute sets containing references to [shame], [ineffectiveness], and [premature climax].

The entity structures for BushCo also show strong links back to our dates previously noted as the 23rd, the 30th, and the first of February. In the case of the BushCo entity, we find these links also containing fiscal or financial references as well as the expected references to Bush's War On Iraq. Again, it would appear from our processing thus far, that a serious 'loss of equilibrium' will take place on the first of February, at least within the fiscal or financial realm. This 'loss of equilibrium' is also associated with cross links back to [banks] and specifically a number of european banking aspects. As may be expected, there are numbers of references to currencies, including the dollar, but the general tone suggests that this 2.1.2005 event/circumstance will be much more than mere readjustment. There are number of attribute sets off the BushCo entity suggesting that the level of 'crisis' rises rapidly following 2.1.2005, and in support of this idea, we find a large area of cross-links back to Populace which go to both financial, and [necessities/core needs/fundamentals] all of which are hanging off an aspect of [shock] or [shocking impact], depending on which level examined.

Another way to examine our data would be to 'flop' it over so to speak, and use [crisis] as an aspect, and then to see what hangs off as attributes. In this case, this effort is less than useful as so many things do hang off this aspect, as though the whole world, every facet of it, and the universe in which it finds itself is in crisis. So slightly less than meaningful.

However, that being noted, and as a closing element to this report, we do find that a curious pattern does emerge within the data when it is 'flopped' over. Within the aspect of [crisis] we find all the primary entities as might be expected, but unexpectedly, and with future oriented emotional sums, we find that all the entities-as-attribute sets, all contain [earthquakes] and all contain these as near-term immediate sum values. Now, this could be due to the large mass of persons perceiving the tsunami as being the 'beginning' of something rather than a 'one off' event. Further within each of the primary aspects of each of the entities-turned-attributes, we find both [violence] and/or [violent shaking/trembling], and again, with forward looking emotive sums. And within the attribute sets hanging off of [violent] we note that aspect/attributes for [shakes] appear in all of them. So this is to say that there is some reference to [shakes] in all the entities including those for political or financial themes.

In some cases we find that [shakes] is being modified with thoughts such as [shakes] the [lice] from (his/possessive) [skin], or in the case of one [bank] oriented thread, we see that it [shakes][fleas/ticks] from (its/possessive)[fur]. Other indications are for the 'shakes' to be accompanied by [thunderous noise/thunder claps/huge noise/large sound] and further (damage/destruction).

Our only timing clues for all this shaking is that it would appear to be a mostly pre-spring focused. There are repeated references to spring and equinox as well as the expected references to space based phenomena, but none have emotive sums carrying much beyond the immediate. So the theme taken should likely be a whole series of 'shakes' are likely to arrive before spring 'settles in' and

that some of these maybe actual earthquakes, with others of   the more virtual kind of earthquake such as appears to be coming for the global   financial system.
****** End of Section B and Part 2

Note that there are substantial amounts of data still being   gathered. Our cut off point will be on or about January 11. We expect that the   next level of processing will be ready for interpretation some-time on January   12, with the expectation of the next report being posted by January 17 (Monday).

NOTE: The data set processed for Part 2 & 3 is POST tsunami,   and therefore, earth focused with negative emotive sums is to be expected.

NOTE: while it is expected that tsunami language will appear   in our data sets the above references are forward looking. They have future-impact   value sums. However, we have no way to judge, at this time, just what level   of dominance the recent tsunami will have on our data sets other than to say   it will be significant. This data set is the first to be run which includes   post-tsunami gathering. This data set must be assumed to be dominated by that   emotional theme, and indeed is very color-ing of the modelspace. Nonetheless,   we have made adjustments to the model to lower the visibility of the immediate   impact lexical sets so as to try to extract those which would be meaningful   going forward. No way of knowing if this effort will be successful.

*****Also note that while the Terra entity dominates everything   within the model at the moment, we also have a great many changes showing up   in many entities. This is forcing a very high-level view of many of the 'minor   players' within the modelspace just to be able to get through them all in a   timely manner. So necessarily some level of usual detail is being sacrificed   for the overall big picture description of the modelspace.*****

01.16.2005 Terra - Antarctica: Alibis and Lies, Tale of Two Cities,Shelter from the Word Storm - Housing, FANNY & FREDDY, Hidden from View - FDA, Disorderly Period - BushCo, Shock of the New - Populace, METADATA/ PROCESSING

Note: Entities are identified by a blue typeface. Aspect words are enclosed in square brackets []. Attribute words/phrases are within parentheses (). Interpretive editorial comments are preceded by an asterisk *.
Data set distilled from 34.14 million reads.

Terra - Antarctica: Alibis and Lies
Note that the recent reports of emergency evacuation of McMurdo Base in Antarctica prompted the searching for data elements related to the continent.
The Terra entity continues to show large, domination of modelspace. In the progressions done with the data from part 1 through this data set supporting part 3, we note that the direction of the mass of entities, all of which are 'blanketed' by the Terra entity, is down below the Zero mark. In our modelspace, we have the 3 dimensional area split in halves. The mean reference line is emotively neutral, and below is emotively negative. Within both upper (positive) and lower (negative) modelspace, as the progression moves from left to right, we gain in both 'distance' and 'duration' emotive values. These values, while always positive, are interpreted as 'magnifiers' to the general trends already in force. So as we progress the entities through the modelspace, we note that the trends are 'diving' relative to emotive values for the Terra entity.
We also need to note that this report is primarily focused on those lexical structures which account for the time from NOW out to about the end of a 4 month period. So, noting that our timing *always* is poor at best, the report is intended to cover from January 1 (first part interpretation period) out to the end of April. Except where noted for longer duration, the modelspace indicates these elements will be involved in these next four months.
Within the modelspace, we find that the Terra entity has values that continue way out through the progression of the entities through this data set. The emotive sums and duration/distance and impact values are end-of-the-scale, and all summations are below the neutral-zero ling. This indicates that the earth will dominate all other elements for humans this whole year and perhaps beyond, and for the most part will be received negatively.
Within the Terra entity we find several large lexical structures coalescing around various descriptors. As an instance, we find a 'star' like pattern of 8 lexical primary aspects with fully populated attribute sets all linked to Antarctica. Given that the emotive sums are all very high in each of the lexical sets it was difficult to pick a 'theme' set from the group. After cross checking the links for 'riplz' {ed: our way of noting ripples of cross links that cascade out like concentric rings from a stone tossed into a pond}, one was chosen; [Alibis and Lies]. This was not chosen as it had the highest level of emotive values, nor was the most prevalent or largest population of attributes, but rather because it contains the longest impacting duration values, as well as having the farthest reach into the next four month {ed: and beyond} period.
In the case of these [alibis/lies] we note that they will be (pouring) from the [spouts] of the [pot] like [steam] from a [teapot]. Further, cross linked within the Antarctica reference, we find that these [alibis/lies] share several attribute sets with the other candidate for the theme, [burning] (down)

the [house]. It appears from the data set that human habitation in Antarctica will [burn] or be (consumed) by [flames] while the [neighbors] (watch) [helplessly/without opportunity to aid] and [occupiers/residents/homeowners/villagers] (weep) for their [future] (lost). Specifically we find that the [village/town/habitation] will (perish) (quickly) in the [flames/fire/conflagration] but that [coals] will (still/continue) to be [seen] even into the [night]. Curiously, there are repeated references to [night] [scenes/views/images] relative to the 'event'. It would appear that the start will be in very late night as in [while/still] [dark] from (previous/earlier/first) and that the [danger/attack/worry] will begin before dawn, and the event will take the rest of the day to play out such that [tears] are (dry/desiccated/evaporated) by [sunset/nightfall], even though there is still some activity into that night which will be viewed with [incredulity/disbelief].

The [abibis/lies] start in the afternoon of the day of the (evacuate/flee/leave/run away) of the [houses] of [wood] and [steel]. Apparently a [group/collective/gathering] will [set about/scheme to/ plot to] (overcome) [real/validated] news with their [alibis/lies] so as to (obscure/hide/secrete under/keep secret) something they deem to be [blood] and [bones] {ed: often interpreted to be 'skeletons in closet' or 'ultimate secret'}.

The [alibis/lies] which will be (permeating/filling) the news sources, will be perceived as such. The cross links from this aspect of the Terra entity go back in large numbers to the Populace entity and there are all linked to emotive sums indicating disbelief and rejection. So it would appear that the [alibis/lies] proffered all that long day will be rejected completely and correctly identified as lies. What will the lies be about? Our Terra entities substructure relating to Antarctica has a prominent group of its lexical aspects which all go to the idea of [brilliance] which, depending on the aspect, is either (emanating) or (striking) or (shining) from the [mountaintop/peak/pinnacle/topmost]. This [brilliance] is somehow active in the destruction of the [village] of [wood] and [paper]. Of course, the easiest interpretation is that the volcano near/on which McMurdo base is located erupts and causes both the evacuation and the subsequent promulgation of lies. However, we have to note that the word (eruption) is not very elevated within the lexical structure, and only appears within one minor arm of a tertiary aspect set. So it might be that the modelspace is indicating that the volcano does erupt, but its participation is minor. Rather we see much more reference to [brilliance] not as (eruption) but rather as [light], [lightning],[illumination], [glare], and other references for [light] as opposed to [heat].

Returning to the [night] notation above, we find that this aspect is not only the [beginning] and [ending] of the event, but also involves (traveling) at [night/in darkness] which has emotive sums indicative of [risk] and [danger]. Further there are repeated links to large numbers of people. Also we need to note that the indication is that the [abilis/lies] related to the people involved in having their [village] of [huts] burned down. These lies, through a link back to BushCo, appear to (alien-ate/drive away/piss off) our [neighbors] who are also involved with the incident. Again, we also note that though the event is likely to have far reaching consequences on its own, it is the lying about it that has the longest durational sums. Further, within the BushCo cross links the primary aspect that is intersected is [arrogance]. Also this aspect's attribute set has several cross links back to attributes within the Antarctica data set which include [subordinate/servant] which in turn is modified by (rejected/rebuffed/offended). One interpretation would be that 'officialdom' in the USofA spouts off some obvious lies about the Antarctica situation and then expects our 'allies' to either go along with them, or actually believe them. Neither apparently will happen and the reper-cussions will be very severe for our [officials/ministers/princes' men]. Further links back to the Populace entity also have the official lies being discounted as such as they are offered which in turn will cause (visible/manifesting)[confusion] and (dithering/spreading/divergent) [voices] within BushCo as regards the events in Antarctica and their response.

One final detail within the Antarctica data set is a number   of references to [global] impact of the event. Whatever the [brilliance] is,   its impact is significant on the rest of the planets' population. This is not   to say that the event itself is 'felt' by the inhabitants of earth, but rather   that there is some long lasting and high impact emotional values associated.   These summation values are difficult to interpret.

Also we need to note the plethora of cross links for this   section of the Terra entity. We find cross links from this segment over to the   Populace entity, as well as to a Space entity as well as back-linked to other   Terra entity sub-sets. These latter include [Two Cities].

Tale of Two Cities

The cross links from the Antarctica focused lexical set   come back through the Terra entity to another complete aspect/attribute data   set which speaks of [two] [cities]. These two cities, within the attribute set,   are described as [mountains] of [people/populace/village/humans]. Again, and curiously, we find references to (shine/shining/illumination) within the sub-aspects   of this set. Further there are aspect/attributes which go to the idea of [sky/heaven/space]   (fire) as (illuminating) at least one of these [two cities].

The aspect/attribute set with the highest emotive sums within   the [two cities] sub-set contains as its primary aspect the concept of (fire)   and (wind) (affecting/altering) the [oceans] which is what places at least one   of these [two cities] at risk. In a general sense, the aspect/attribute groups would have one of the cities (return/go back) to the [mud] from which it (originates/sprang   from) while the other will (fall back/crumble/drop down/cave in) to the [ocean/sea/estuary/brackish   water] near which it (sits/resides/reposes).

Now noting that we are frequently wrong in which sets of   words to chose out of an emotive cluster {ed: lexicon of words with the same   general idea, and all possessing the same characteristics for duration, impact,   distance}, we still need to note that these are large sized cities referenced   here repeatedly as [mountains] of [people], and that while seen in modelspace   as larger disasters than the Indian Ocean tsunami, the implication is that [minds]   will (become) [numb/shocked/insulated/deadened] due to the sheer size of what   happens within its time period. Curiously, other than the [denial] seen as a   component of the [alibis/lies] of [ministers/officials], the cross links to   the Populace entity show no signs of [denial], rather only (horror/horrified)   (acceptance). Previously, in last years ALTA reports, and especially relating   to the [water] focused themes which were to {or have} played out, there were   aspect/attribute sets which indicated at least initial (disbelief) on the part   of the Populace as to the scale of events. Not in this case. Apparently the   Populace will readily accept what is happening even though the general 'tone'   of what comes through is (numbness). At least in the case of the [two cities]   the [numbness] is seen as a result of [shocks] (too numerous/over-the-top/excessive)   to (sustain).

Our timing is always suspect as this is the most arbitrary   part of the process, and as a result, our ability to determine causal relationships   is likely impaired. However, from the lexical structure that we have existent   in modelspace with the total data set so far, we can be confident that the events or issues involving Antarctica are 'incidental' to, and not fundamentally the   cause of, the problems besetting the [two cities]. Rather, it would appear that   large scale changes within the Terra entity are responsible for both the [two   cities] plight, and the Antarctic events. The indications are that the [two   cities] will arise subsequent to the Antarctic events, but we are not able to   discern much time between them. However, the modelspace is so rich with elements,   that this may be an artifact of the scales we have chosen as opposed to any   real time separation between the events.

Also incident to, but in this case partially responsible   or at least linked that way, is the idea of a [wind] which will affect the [oceans]   at about the same time as the beginning of the problems for the [two cities].   This [wind] will be the result of [fire] and within the lexical structure, is   seen as

being partially causal to the [suffering] and other negative, bespoke   emotions which arise within the Populace as a result of [witnessing/observing]   the plight of the [two cities]. We also need to note that the [wind] involved   is [ocean] originating or affecting in spite of the references to the [source] of the [wind] being [fire].

A curious cross-link, involving the [two cities], and linking   back to both the Populace, and BushCo, shows a web of inter-linkage around the   aspect of [preparation]. Further, there are sub-aspects which link back to BushCo   entity showing that large amounts of (effort/energy/expenditure) will be focused   on this [preparation] and further that the [preparation] will be for an [exterior]   (orientation/view/sight). The [preparation] involves [underground] (support/shelf/level).   This lexical element is cross -linked back to BushCo and its Antarctic [alibis/lies]   through wording which says that [underground][roots] (once/previously/in the   past) (hidden/obscured) (will be) (revealed/uprooted/ exposed). As an editorial   note, this whole lexical structure is 'active' and possesses values indicating that an on-going effort towards the (hidden/obscured) is deliberate and is active.   These (hidden) [roots] will be revealed within the [discussion] centering around   the [alibis/lies]. Of all of the emotive values within modelspace at the moment   which are not Terra entity encased, these [alibi/lies] values have the longest   duration, and highest impact sums. This suggests that the effect of the disclosure   of the lies will be very far reaching, perhaps extending the whole year or more.   Please note though that this progression of the modelspace is most focused on   the next four/4 months.

Shelter from the Word Storm - Housing, FANNY & FREDDY

Within that part of modelspace in which the financial lexical   structures congregate, we find a complete entity with two 'faces', that is,   a doubled primary aspect. While not unknown, this structure is nonetheless rare.   It was last seen prior to, and was descriptive of, the Olympic Games opening day this past summer. Again, as was seen then, the structure is populated with   emotive values signifying 'immediacy' or a short-term horizon. Unlike with the   Olympics, this structure appears to play-out over the course of several days,   six/6 specifically mentioned, and one included as the day of the occurrence   for a total of a week of activity.

The activity of the structure is, as noted, two-faced, or   doubled primary aspects. The two aspects are for [housing/shelter/residence]   and the other represents [FreddyMac/FannyMae]. Taking the latter first, we note   that this side of the structure contains completely populated attribute sets which go specifically to three areas: the [staff/workers] of the institutions,   the [ministers/princes/ potentates/managers] of the institutions, and the [financial/fiscal/economic/budget]   of the institutions. There is no separation within the structure between the   two, FreddyMac and FannyMae.

The other primary aspect of the structure is [housing/shelter]   related. In this case, within this attribute set, we note another doubling of   usage as this attribute set denotes [shelter] as in physical housing as well   as being internally cross linked back to the connotation of [shelter] from (the coming/due/on its way) [storm] . Now in this case, we also find a specific cross   reference back to (of the/of a part/created of/composed of) [words].

Within the sub-section dealing with [housing] as a physical   structure to shelter humans from the elements, we note that there is going to   arise a confluence of events in which the [housing] will be (abandoned) in [large/great/maximum]   measures by (former)[residents] who will now be seen as [visitors] in their   (former) [housing/shelter]. This large abandonment will be bound up with a three day period which will lead to someone, likely from the other side of the structure,   that is someone with authority at one or both institutions who will [enflame/ignite/propel/set   off] a [storm] of [words] over some reference to [reform/reformation/cure/cleansing].   Somehow this will be part and parcel of the actual abandonment issue.

The [word] [storm] is seen as being so ferocious as to (remove)[oxygen]   from the situation. Further, during this period, the issue of [abandonment]   is seen as (removing/taking/diminishing) the

[housing/shelter]. This structure   contains so many references to the (removal) relative to [housing] that it is   being taken as an indicator of a possible sharp drop in housing 'values'. So   much and so [precipitous/sharp/edge] is the [removal] that this element enters   on the [middle day] of the [word] [storm] and marks the end of the beginning   and the start of the next phase of the (gathering/building) [word] [storm].

As part of the storm of words seen developing over housing,   will be some [measure/amount/contains] of verbiage devoted to [reform]. This   is the start of the large [removal]. It would appear that some not well considered   language, in the midst of a developing [staff] and [financial] crisis over [housing]   will (ignite) a storm of words which does not bode well for the housing 'industry'. There are a large number of cross links back to the BushCo   entity, as would be expected for this sub-structure, however, there are also   a similar number back to the Terra entity, but the overwhelming number of 'fits'   actually place this structure deep within the Populace entity, subordinate to   the aspects relating to personal well being. This developing trend has been   seen arising over the last two years, that is, the abstractions of the financial/governmental   system becoming 'internalized' within the Populace entity just prior to large   scale changes. As a meta function, we might be able to postulate that when a   subject matter word collection 'joins' the Populace entity from another entity over the course of some months, that very large scale changes of consciousness   and context about that subject are in the process of occurring. It would appear   that such a change is about to manifest relative to housing and the F's.

Hidden from View - FDA

The lexical arm of the BushCo entity which contains the   aspect/attribute references to FDA as an institution shows a large number of   changes. These changes show a shift toward (revealing/revelation/showing/exposing)   of [what] (was) (hidden). This [exposure] will place a [regime] (at risk), which   in turn will put the person at the center of the revelation at risk themselves.   Specifically the words for (imprisoned) and (exiled) as actively applied or   considered measures arise. The substance of the revelations about the FDA will   involve the exposure of something that was (made to/caused to) (vanish). The   'vanished' item will re-appear, to the great consternation of those involved   as they will exhibit by [clouds] of (confusion) and (obscuring) [thoughts/opinions]   will be proffered to try to (hide from view/conceal/obscure) the [intelligence/information].

Whatever the to be revealed information is, it will relate   to [respiration]. It appears that some information will come to be exposed in   which the [respiration/breathing/inhalation] will be seen to have been (caused   by/created by) [greed] and (callous/uncaring/inhuman) (consideration/thoughts/caring/empathy/compassion)   for the [afflicted/ill/beset upon]. This is seen as (crushing) the (false)[work   of](decades). Now this last is a curious attribute set which has not before   been seen and is, in this case, being interpreted as an 'image' or 'lie'. It   could be that a multi-decadal effort has been underway to (deceive) the Populace.   And not coincidentally at all, we note that the cross links from BushCo at this   level of the structure go right over to the Populace at the level of a tertiary aspect which is [victim]. Another curious note is that the Populace entity at   this level also contains references to [race] as in the concept of 'racial'   differences between humans. In our modelspace, and especially with the many   cross links to other aspects/attributes heavily populated with medical terms,   it would appear that what will arise is some level of 'racial' specificity involved   with the idea of victims.

The outcome of the FDA mess as noted here, continues to   play out past the points of examination within modelspace as it is defined for   Part 3. Therefore this would seem to begin soon, but continue beyond the next   four months.

Disorderly Period - BushCo

The BushCo entity has a distinct lexical structure representing   the 'inauguration' or as seen here

(coronation) of the (small)[prince]. Now we must note that the whole subject of Bush is so emotionally hot as to prevent any meaningful interpretation. This is due to the 'consciousness' level of the discussions relative to BushCo that our spyders pick up. As a method due to the emotive sums around BushCo always being at the top of the scale no matter what aspect/attributes are examined, we are dismissive of almost all lexical structures within BushCo itself. There are far too many subject areas within BushCo, all of which have maximum emotive sum values, for any real examination of this entity. So we sort of sniff around the edges and see what other lexical structures are cross linked back.

In this case a small, but interesting aspect relative to the inauguration arises above the general 'noise' of the BushCo entity with the following aspect/attributes: (feasting/drinking/partying) and conjoined as co-aspect, is (stealing) with an attribute chain containing, (vulgar behavior/not socially acceptable/immature/sophomoric), and (cheating) and (lying) to [eyes]. Also, we see that this (lying) to [eyes] brings about a (disorderly)[period/segment/time] in which the cross links to the Populace entity suggest that they will perceive (emergency) and [shortage]. Further, we note that during the (feasting) some (withdrawal/retreat/fading) will occur during a [moment/minute/period/timeslice] that all will (see/view/perceive) as (dangerous). A [position] will be the center of the (danger) and a [timely/appropriate/right moment] (disappearance) will occur, perhaps. This lexical structure has some ambiguity about the outcome of this [moment] of (danger).

The ambiguity of the outcome of the moment appears to only exist for the [revelers/participants]. For the rest of the Populace entity the emotive values summations are very clear; the 'inauguration' will be widely seen as [alienate/put off/repel/disgust] the [crowds/populace/citizens]. The structure points out that (enforcing) the [distance/separator] does not (hide) or (diminish) the [hatred] that will be seen, nor it would appear, stop the [words] of [degradation]. This latter is cross linked back to the Populace entity and twice intersects with [loss/lost/left behind/forgotten/abandoned] which contains attributes going to [friends], and [familial allegiance].

The BushCo 'party' is seen within the modelspace as being a definitive moment leading {as will be seen concurrently} to alienation and disorder. This entity, when progressed through the time scale within the modelspace, drops from its current not-so-high rating at slightly above the neutral line, to completely below neutral, and into negative territory within the next four months. For BushCo, the modelspace is projecting a very emotive, and rock/crisis strewn period. Unfortunately, we all have to live with the response to BushCo's problems.

****Again a brief note about the process here. This run has had more lexical changes and increases in emotive sums around usually neutral subjects than could be interpreted in a single year. That is, every entity is showing change levels which are unprecedented in our experience with this work. As a consequence, the computer processing of the data is taking longer, the number of words coming back per read is larger, actually running within .9% of maximum as an average of 91% filled reads are coming back. This compares with a usual 'plumpness' level of about 43%. So we will get far more data, but with fewer reads, than in any previous processing. Also this extra time required to deal with the data volumes has imposed interpretation time limits on viewing in modelspace. This arises from two areas: the first is an attempt to just get through the interpretation in a timely manner, that is, before the interpretation could be come out dated; the second area is that there is so much change evident, and the rate of change has so accelerated that processing is eating many more hours than usual, and interpretation *should* also consume more hours as there is much more to interpret.

*****However, at some point, too much data shades over to meaningless interpretation. In the aftermath of the tsunami, emotive hot spots within the model have risen to an all time high. At some point it is merely a guessing game as to which of the entities to interpret, given that there is too

much data to interpret them all.

Shock of the New - Populace

The last entity undertaken here is the Populace entity as a summation of changes observed within the progression of the elements through the modelspace. In a general sense, and not unexpected given the recent horrific tsunami, the Populace entity is going into [shock]. This [shock] is seen as arising from the sheer scale of the [new/change] that will be or is currently being encountered. The [shock] is seen as a descriptor that leads to an emotive [numbness] as a state within the general Populace. This is not to say, a state of unawareness, and that is specifically referenced within several of the attribute sets, but rather a state of [aware/seeing/viewing] [shock], as though completely transfixed in awe at the scale of the [boulder/rock/obstacle/crisis] rolling down-hill at you. Sort of the deer-in-headlights syndrome, only in this case it is human-in-headlights-of-mega-ufo variant on the theme. That is, the level of change to affect the Populace entity will be significant. Contained within the descriptor sets hanging under [shock] are repeated references to [life](changing/altering) and [life-long/lengthy/infinite] [duration]. The emotive balance for all these changes during the progression through the modelspace is toward the negative as time moves forward. Again, note that this Part 3 interpretation is limited to about 4 months, with only a few descriptors that go as far out as June of this year.

Within the Populace entity, and pegged to its time scale are the cross links back to the Populace 'view' of the impending problems with Terra, including the Two Cities and Antarctica. It is these two specifics which were extracted from the very many changes within both Terra and Populace that we have chosen to fix our interpretation upon. At this point in the model, that is with so many changes to choose, it is only luck and happenstance that guides our 'guesses' as to which will be very significant. We do note that the processing limits of mostly to end of April with only a little spill over to June of this year would suggest, due to the lexical structures, that these events would emerge, and be seen as 'completed' within that time frame.

One further note is that the two cities are seen as being 'antipodal' or 'opposite'. The lexical clues here suggest that they will be very far apart geographically, yet both involved in problems within the same time frame. This, on its face, suggests that a globe affecting event will precipitate the problems for each of the two cities, even though their individual crisis are different.

META-DATA/PROCESSING

As this is the middle of the data run, we do not yet have any geographic clues filtered out. Usually those do not emerge until the last level of processing. However please note that the huge volume of speculation at a conscious level within the conversations which we sample, and the huge increase in bespoke geographic references likely means that any geographic references which do emerge will be meaningless. That is, too many to specifically see rise on their own.

Our data run is very large and the processing is very taxing at this stage. So Part 3 ends here, and we are rushing to get the part 4 data set in place for continuation of the run, with the expectation of posting Part 4 in about 7-9 days time. Should anything pop-up on its own that would seem of interest we will send out email notification and may post addendums to Part 3.

As there are huge levels of changes being reflected within our data set, we could drill down pretty seriously for well over a year on just this data. However the shift from mostly long term to mostly immediate impact summations would suggest that even extending these reports out to 6 or 7 parts may be moot, in that the time period covered by the data would have passed by the time the processing and interpretation could be completed. Does that make sense? Too much at too fine a

granularity to get at it in the time period covered.

In any event, email notifications will be sent out if anything   pops up. At the moment, Igor is on shift with data gathering, and I am going   to take a much needed break from these last 6 days of work. As Igor notes, the   Part 4 data set is significantly more full than Part 2 or 3 which suggests even   more changes to plot into modelspace once the data is through mid-stage processing.

NOTE: The data set processed for Part 2 & 3 is POST tsunami,   and therefore, earth focused with negative emotive sums is to be expected.

NOTE: while it is expected that tsunami language will appear   in our data sets the above references are forward looking. They have future-impact   value sums. However, we have no way to judge, at this time, just what level   of dominance the recent tsunami will have on our data sets other than to say   it will be significant. This data set is the first to be run which includes   post-tsunami gathering. This data set must be assumed to be dominated by that   emotional theme, and indeed is very color- ing of the modelspace. Nonetheless,   we have made adjustments to the model to lower the visibility of the immediate   impact lexical sets so as to try to extract those which would be meaningful   going forward. No way of knowing if this effort will be successful.

Part 4 - Stock Market(s) - Idem vice versa, Iraq, Terra - south west, river of rainwater, sun pours out, weather revolution, New Zealand, Asia,   food & volcanoes

Asymmetric Language Trend Analysis Intelligence Report
  Changes in language precede changes in behavior.
  By Tenax SE for HalfPastHuman.com

01.23.2005 Stock Market(s) - Idem vice versa, Iraq, Terra   - south west, river of rainwater, sun pours out, weather revolution, New Zealand,   Asia, food & volcanoes

Note: Entities are identified by a blue   typeface. Aspect words are enclosed in square brackets []. Attribute words/phrases   are within parentheses (). Interpretive editorial comments are preceded by an   asterisk *.

Data set distilled from 42.6 million reads.

Stock Market(s) - Idem vice versa

For a change we will start with some specifics of a small entity representing the various 'equity' markets. That is, this entity arises within the over-arching Financial Entity, and represents those lexical components which reference specifically the paper-based, equity/stock markets. This entity is global in focus, but expectedly, over 70% of the verbiage is USofA associated.

As was noted in the update from Part 2 data, we find a curious few dates arising as single instance representations. This is rare as we usually see dates arise as a range. These four dates of January 23, 25, 30 and February 1 are all within this lexical structure focusing on Stock Markets. We need to note that both the 30th of January, and the first of February are also found in other entities more geo-political in nature. '

Within the Stock Markets entity, these days have a higher percentage of lexical weight than within other entities due to the small size of the entity. And all of the dates noted seem to focus on the (loss) of [equilibrium] which will be (felt) like a [gut/stomach/solar plexus/core](kick) on February 1. Also the impact emotive values for this (kick) due on Feb.1, 2005 is such that it is at the top end of the scale for both duration, and 'spread' or breadth of impact. So this kick in the guts is going to have a long lasting impact as well as be felt very broadly. To this latter point we note that almost all attributes within this entity also have cross links back to the Populace entity. And within those cross links, the Populace entity has inter-entity cross links back to [food/sustenance/basic] (supplies), and that these elements within Populace are all hanging under the aspect of [shortage/dearth/lessening/lightening]. The implication surely must be that circumstances produce events which will be or should be visible by or on February 1 which will be stock market centered but be widely felt globally and will be linked to basic commodities or the lack thereof.

As this Stock Market entity has very high (-4 out of -4 to +4) summation values, the specifics of the aspect/attribute sets may be more meaningful than the summation values. While negative, the aspects are also forward looking, this is also a rarity, as most negative summation values only have short-term, future-forward, time impacts. This entity is an exception with word groups which have multi-generational summation values indicating, on face value, impacts that have a carry forward level in excess of 25 years. These values going toward the [next generation/sons/grandsons] suggest that the Stock Market entity will (reveal/show/expose) [fools/foolishness] which will still (beset/sit upon/drag down) the [son's son]. And that the (lack) of [discipline], and the (toleration/ignoring) of [fools/the foolish] will bring (humiliation). Note that 'humiliation' is usually seen in our work as a static value with past looking sums, while this case is both active, and carrying forward into the future.

We also have lexical clues to the coming failures of (manipulation/rigid guidelines/enforced compliance) which (throws) [itself] (away) in an attempt to (be close/close with/achieve) (fervorently) [desired] [goals]. And that this (throwing away) will lead to a [single/one/only] (step/move/shift/movement) in which [equilibrium/balance] is (lost). Further we find that as with in nature, equilibrium once lost is [never] (available/resource) which suggests not recoverable.

In their apparent zeal to (bond/unify) with their (fervorently) [desired] [goals], the (owners/masters/princes/kings) will provide an (opening/opportunity/chance/circumstance) in which their [foolishness/fools words] will be viewed (plainly/starkly/openly/harshly/under glare). This exposure, while not central to the lexical structure, does provide a curious secondary aspect/attribute set in which we see a [woman] of (stature/height/presence/power) who will (reject) the [rich](man/men/group). This may be indicative of either an internal power struggle which rises to public view, or as has been the case in the past, a female 'whistle-blower' comes in from the cold. This person is clearly seen within our lexical structure as being deep within the core of the [group/tribe/affiliation/cult/society]

and (exposes/reveals) so much about the [petty] (rich) [man] and his (brethren) that her life is in danger. Our lexical structure within the entity suggests that her salvation and safety will be secured due to the [dam/levy/holding back] (rupturing/splitting/breaking) such that over the course of [three/3] (days) the [reservoir/holding tank/supply/resource] is (emptied/drained/released) by [half]. And this (rush/crush/stream/river/tide) is seen, within its cross links back to the Populace entity to (create/demand/elicit) (howls/howling/shouting/screaming) of such (rage/hatred) that [blocks] will be attempted by the powers that be in order to (control) the (carnage/death/killing). Curiously, we also have an 'echoing' thread within the Stock Market entity which forms one of the numerous cross links back to the Populace entity, and this echo is centered on, and hangs from the aspect of (carnage/death/destruction). Its attribute set is entirely self-focused within the Stock Market entity suggesting that much of the damage will be self-inflicted, though the image of rampaging mobs of pissed-off Populace sure comes through the lexical conjunctions.

We continue to note very high sums, also negative, and also very high durational emotive summation values {how far the meme will carry into the future} for everything associated with the FannieMae/FreddyMac complex. The negative emotive sums also carry down in to the individual aspect/attribute groups. Whereas the past runs would show a specific area of negative emotive sums, e.g. the 'shortage' aspect which emerged with the pharmaceutical industry, in the case of the F's we do not see that. We see instead, a whole range in which even the most positive valued aspect/ attribute groups are just neutral. In excess of 89% of the aspects are negative at both core, emotive sum, and impact/duration. Not all are at the high end of the scale {only 23% reach maximum summations} but all are negative shaded. Within the modelspace the F's lexical group has fallen below the mid-line of neutrality, and appears to be dragging down many other lexical groups which are cross linked to it. Usually we find that entities share numbers of cross-links bi-directionally, in this case there are predominantly cross links down to the F's group, and not very many back out. The suggestion has to be toward a 'dragging' effect from the FannieMae/FreddyMac's on the rest of those cross linked lexical groups. These include general economic focused terms, a large government focused group, and the cross links from the Populace entity which as may be expected are 'housing' oriented. The durational values for the impact carry ability into the future are multi-generational, which for purposes here, we tend to translate as 25+ years.

As for the rest of the economic focused aspect/attribute sets, specifically for those within a 6 month period {ed:note our timing is less than reliable}, and most specifically for those lexical sets which are cross linked back to the USofA data indicators we find that the general 'flavor' of the period will be determined by the primary aspect of (wrestle/wrestling) the [herd](instinct/intuition/inclination/movement). Further this (wrestling) against the 'herd instinct' will be against a background of (loss) of [consistency], where the (stated) [goals] are found to (lack)[validity]. Further the [persons/people/participants] involved will show themselves to be (unreliable), and they will be (shocked/bound/restricted) to [docility] by circumstances. Again, there are repeated cross links back to the Populace entity and specifically to some 'echo' lexical sets which also speak to [herd](instinct) and [repel/rebuff/fight loose] which suggests at least some contention with economic reality versus economic perception will arise. As the lexical carry values show, we see more of the attributes indicating that this emerging tussle with herd instinct will happen early within these next six months such that by the time we reach June, the majority of the [herd] will be discussing these circumstances in the past tense.

The associative value sets for all the descriptors for the new mindset of (wrestling) the [herd] (instinct) all resolve back to sets representative of [misfortune], (humiliation) {ed:note this is active, and on-going}, [disgrace], [loss], (losing/failing), (persistent)[misfortune/bad results/bad luck], and others of similar vein. These values also are linked to entities and lexical sub-groups which have

multi-generational carry values.

Iraq - Same Old Instability

Basically, the whole economic and fiscal/financial focused lexical group structure does not bode well. As to specific points of 'not well', there are really too many from which to chose to be able to render meaningful interpretation. The indications are that geo-political events, as well as bad economic news will soon (ignite/spark/set off/begin rapidly) a movement of a [herd] mentality. IF ONE HAD TO GUESS, it would be reasonable to suggest that emotional shock of [nothing/null] change will result from the voting in Iraq, and the dawning realization of more of the same instability, chaos, oppression, and insurrection coupled with very discouraging economic indicators will precipitate a new attitude in the Populace. This new attitude will be seen as a more dramatic change within the USofA, but has global spread values, and will reference a fundamental shift in thinking. What we may be seeing rise from the lexical clues is the long awaited, much prophesied 'collapse of confidence'. Should that be the case, the target date of February 1, still stands out in our processing as marking some form of point of delineation for before and after.

Going further into the processing, and pursuing the cross links from these attitudinal changes we do note a number of connections to Iraq, and Bush's War in Iraq. Further, in support of the idea that events in Iraq will form a key pivoting point for things of an economic nature in the USofA, we find that many of the lexical sets associated both with Iraq and the economic cross links to both the Populace entity and the economic lexical sets, include such negative references as [south](over estimate) [strength], and again [south] focused, (forced) to [walk](misfortune), and [south](progress)(without)[advancement/accomplishment]. Also, noting the [middle] is [skin/hide/covering] (flayed/knifed/sliced) of [buttocks/lower quarters] which contains many attributes going toward (laborious) [non/not/no](achievement) which also links back to the Populace entity in an 'echo' set which is (no/loss)[accomplishment/gain/results]. The interpretation for this is obvious that folks back in the USofA will see the whole of Bush's War in Iraq as resulting in, and labeled by, the results or non-results of the elections. Further, taking the total sum of cross linked emotive values within the data set and progressing them through the modelspace indicates that the emotional tone of the Populace entity as related to the economic elements within itself will be tainted or 'flavored' by their emotive response to the War in Iraq and most significantly, to that period of time immediately following the elections in Iraq. Again, our values for change factors from this whole run point to February 1 as being a period of very likely high emotions being manifest which fits with the lexical sets details around that date.

And as we pursue further Iraqi cross linked aspects, we find that [mud](covered) repeatedly arises, associated both with [middle] and [north] though less so the [north] on total elements. Also within this set are (run) into [partisans](misfortune), though this is tempered with (averted) which is connected to [flock/group] of [friends]. But the Populace controlling primary aspect for that area cross connected to Iraq shows that [words] (shouted) are [not heard]. This is representative of the total lexical set, all of which are negative in summation values.

Terra - south west, river of rainwater, sun pours out, weather revolution, New Zealand, asia, food & volcanoes

We have a cluster of references within the Terra entity that have built over the course of the processing as we increase the number of data points included. In this case the idea of [south west] arises repeated to the point of becoming a primary aspect under which dwell a number of primary attributes and secondary aspect/attribute sets. In this case we do find a number of references to USofA, but in general this number is only slightly higher than all other references combined, and this is only the case when we take Continental North America into account. In the many primary attribute sets we find that (rushing) [water] is very key. Additionally, there are repeated descriptors

of [sun/sunny/lighted](warms/heats/inflames) [dark](rushing)[water/waters/rivers/water courses/ waterways]. Also under the same primary aspect set, we find several cross linked references to [fire], (energetic/burning/inflamed), and (heat/hot). Many of these [fire] references are subordinate to, or under, [water] aspect/attribute groups. There are explicit references to [danger] and (danger- ous/perilous) [conditions/circumstance/happenstance] related to the [fire] under [water]. It helps in the interpretation to remember that the indication is for [south west] but this is not the same as South West, and it may be referring to an area off the south west coast of the USofA. This might be indicative of some volcanic activity under the sea. Also associated with these lexical structures are cross links to [displacement/movement] and (shift/move/relocate) within the Populace entity.
river of rainwater

A cross linked element within the Terra entity goes to the [south west] data structure, but does not hang off it. Nonetheless, it is completely cross linked back to multiple sub aspects of [south west]. These links form around the grouping of [river/water course] of [rainwater] (propelled/lifted/raised) by [heat] (glimmering) (below) [dark][waters]. This [river] of [rainwater], while not arising within the [south west] has most of its structure point at the [south west] as though arising from there or having the most impact there. Of course south west is a vague description at best, and very ambigu- ous, however, the implication from many of the emotive sums of the groups are that this river of rainwater will not be felt in a positive way, at least initially. There are also our curious pointers to large numbers of people. Again we are finding that the interpretation is for large areas of the [south west] to be impacted.

The impact from this river of rainwater does not appear to be limited to the south west exclusively as there are aspects where we see the [mountains/hills] of the [south east] {ed:or on their south eastern side} (cut/carved/sliced) into [alternating/periodic] [ravines]. There are also suggestions that the carving will permanently create new water channels. In at least one case [residence/habita- tion] will (move/relocate/adjust) and cause the hurried migration of whole population centers.
sun pours out

Cross linked from the south west, and from the river of rainwater which is seen as being created by [fire] under [water] we also find that a significant portion of the new material added to the Terra entity has [sun] focus. These lexical structures suggest that the [sun] (has/will) [let go/release] as it can (no longer/not any) (restrain/hold/constrain) the [tension] any longer. Curiously we find that a structure that first arose relative to California, that of [inner] [tension] is now showing up in a [sun] based attribute set. We also find that there are two separate, but mirroring views of the [sun] from an emotional view point. The first is seen with the [sun] as the causative factor for mood shifts that will (affect/impact) [whole/complete/total] [countries/populations/peoples]. Further the impacts for these mood shifts are to be seen as a [disease/illness/disharmony/disruption] which will impact by [loss/lost/removed/gone] the health care system. The [sun] [disease] is seen as causing some serious levels of disruption for the health care and other personal contact businesses. There are some references to [contagion] but very few, and with low emotive values, so it appears that the [per- sonal/private/individual] effects of the [sun][disease] while not contagious will nonetheless (limit/ restrict/constrain) human-2-human contact. Perhaps the 'weakness' of the (contagion) lexical line is indicating that this part of the evolution of the sun disease will be either minimally impacting or only exist as a temporary measure as humans learn that the disease is not contagious. A further note about the sun disease is that we find that about one third of the way down its lexical structure we encounter [sick/ill] [food/grains/fruits/agriculture] as a 'fellow sufferer' of the [sun][disease]. This section of the aspect/attribute set has values indicating a long term impact, and a short term imme- diacy. The immediacy values cluster about the June 2005 to September 2005 time period. So the expectation will be for the sun disease to show up both in crops and humans this summer.

The second, and mirroring view of the sun emotionally arises   from our emotive sum values for various meta-view data such as duration, impact,   and other values. The indications are from the emotive sums of the [sun] focused   aspect/attribute sets that the sun will be seen as a causative factor for wide-spread   fear reactions. We not only have negative values, but those negative values, when compared to our base sets within the lexicon are at the level of [fear],   and companion associative lexical threads for [intimidation] and [scared]. In   this sense it would appear to suggest that in addition to, or perhaps preceding   the appearance of the [sun][disease] we will find a rising emotive view of the   sun as an object of fear for humans. These values for the emotive sums are at   levels above the specific and as such do not represent the outcome of the individual   lexical elements but rather represent the over-all emotional response to the   subject from very large groups of people. In a real sense, these emotive sums   are the view of the 'crowd'.

There are, as expected, a number of cross links from the   [sun] focused lexical sets to aspects/ attributes in other entities as well as   back to other sub sets of the [sun] component itself. In one case a group of   cross links form almost a 'rope' of threads going to economic centered word groups. These include one complete aspect/attribute set which is hung off the   primary Populace aspect of [recreation/sport/relaxation/vacation]. The indication   here is that the [sun] is about to send the various recreation and sport businesses   into a [drop/fall/plunge] into the [abyss/canyon/ scar]. These threads are compounded   by the [sun][disease] specific attribute sets, but even within the Populace   entity we note several layers of negative emotive sums centering around 'recreation' in an outdoor setting. While this might bode well for bowling and poker-playing,   and other indoor activities, this section is also deep in the core of the 'idem   vice versa' component of the Stock Market entity. The suggestion here is that   amongst and in the midst of all the other economic issues arising will be a   serious impact on those industries which rely on outdoor activities. Obviously   this includes such things as tourism, and many travel related recreations, but   also, we note the impact on such areas a [ferries], [bird watching], [trains]   and the obvious [surfing], et al.

weather revolution

For that period suggested by the summation values for duration   and emotive impact which roughly extends through June of 2005, we find most   of the lexical structures have clustered around the immediate 4 months from   February through May. Within this group, the most cross linked sub set is linked   back to a structure which can easily be interpreted as [weather] in (revolution).   While (revolution) has both the connotation of circular movement, there are   more indications of the alternate connotation of (upheaval) being accurate.   The descriptor attribute sets are replete with references to (upheaval), (up   ending), (over thrown), (toppled) and other 'bottoms up' images. Where these   might be expected to be more normally applied to human political activities,   in this case the interpretation is to an actual (upheaval/reversal) of weather   patterns or trends. The 'weather revolution' is also seen as causative to governmental   changes. Within the lexical structure we find that the changes to be seen in   the government {unknown as to location} will not be merely internal changes,   but rather, in keeping with the 'revolution' theme, will be widespread or [whole-sale/complete]   changes in government, perhaps even down to form. The aspect chain clearly indicates   that these changes will be responses to very rapidly emerging 'weather revolution'.   As might be expected, the range of afflicted or affected human activity is large   and detail aside, no part of social infrastructure will be immune. It is the   total impact of the 'weather revolution' which will force the (changes/alteration)   of [government/administration]. There are a number of cross links back into   the Populace entity which indicate that these changes will, on the whole, be   accepted .Apparently a resource or conditions driven political change will arise   in which the obviousness of the implications do away with much debate or wrangling   in the face of crisis.

The weather revolution, bound up with the 'river of rainwater'   also has a separate structure which is

cross linked back to the 'flame heated   water' image associated with the 'river of rainwater'. In the case of the [weather   revolution] aspect we find that it too is [flame/fire/heat] (driven/impelled/ carried/forced)   and specifically the [weather revolution] will have much of its driving force   as [flaming][respiration]. Attribute sets under the [respiration] component   go toward [bellows], (puff/ exhalation), [air/wind](bagged/sacked/enveloped).   Under the [flaming/flame] component, we do find several references to [volcanoes],   as well as cross links over to the [air/atmosphere/ gas](belching) under the   sub attributes under [bellows]. One interpretation obviously would be for increased   volcanic activity to alter atmospheric conditions and perhaps 'life-ability'   within countries causing geo-political changes such as 'governments-in-exile'.   The implications are that the weather revolution is not a local event, nor limited   to only one locale, but rather will be globe affecting. It also appears to be   an issue of immediacy, as occurring within the year, rather than some nebulous   multigenerational slow process. Not an event per se, but more likely the emergence   of new trends and patterns so rapidly that the change level can cross the consciousness   boundary for the human population of the planet.

Since the tsunami hit the Indian Ocean communities, we have   had to alter our processing by increasing our geographic filter programs significantly.   The issue is the extremely large jump of data referencing specific geographic   points. In this run we have found that geographic references have gone up three   orders of magnitude. This affects both our band width and our ability to pull   out any 'meaningful' geographic references from the general 'spew' that feeds   the spyders. In other words, too many places being named. The geography of human   activity on the planet took a huge jump up in our collective consciousness as   a result of the tsunami impact. As might also be expected, so has the number   of references to fear valued weather, earth changes, solar activity, earthquakes,   tsunami's and other manifestations of planet earth. While this latter is troublesome   to the processing, we have had a lot of experience filtering and mining this   sort of data, and so have a higher degree of confidence in our 'extraction abilities'.   The plucking of geographic references with meaning is another issue. Much harder   now, extracting geographic references with meaning is currently improbable given   the excessively large data sets, and so we limit ourselves to the vague [south   west] sorts of references.

New Zealand

Now, that having been said, we note a statistical anomaly   with regard to references to New Zealand, with a slight shading for other geographic   areas of close proximate. This statistical deviation is 3 times standard deviation   and so warrants a closer look. When we examined the aspect/ attributes and cross   links we find that a primary aspect of [lookout] or [lookout post] which is   on or associated with [bare mountain/stark rock] is about to undergo significant   shaking. The aspects/ attributes would have [lookout post] (shaken) by its [poles/stilts/legs]   and its [feet] will be (destroyed) such that the [lookout post] is (overthrown/cast   over/tipped over). It will (lose) [steadfastness] and [humans/humanity/persons]   will be (pitched) into [hell]. Further the [frame] of the [lookout] will be   (rendered/sectioned/pulled apart) leading to its [complete/total] (destruction).   There will be many (wounding's) though the indication is these are (issues/constraints)   of the [skin/covering]. This lexical structure is also [autumn] associated,   and suggests that the [lookout post] is [past] (focused/centered). There are   repeated references to [subterranean] and the (loss/lost/losing) of [stillness/equanimity/balance].   Obviously the interpretation is for a larg(ish) earthquake near a 'look out   post' in New Zealand. As there are already a number of new quake patterns emerging   in New Zealand this lexical structure is likely referencing these, but as our   data collection efforts ceased on January 14th (got a few extra days from our   OSP), the lexical structures are not likely drawn from these actual quakes.

Asia

At a larger level, we also find a statistical change in references to [asia]. However well explained by the tsunami event, it nonetheless is worth investigating. Our lexical structures for [asia] associated aspects, specific geography aside, are all clustered within fear driven emotive valued aspects. Of course, this is completely natural and expected, given the death toll and earth changes caused by the tsunami. We must note though, a lexical curiosity has arisen within these data sets where we find repeated references to (waiting) with emotive duration impact values suggesting a period of two/2 seasons. The image that comes through, accurate or not, is that the whole region is 'waiting for the other shoe to drop' and that their projection has it coming within 2 seasons.

The impact of mega-disasters such as the tsunami, and their psychological effect on large human populations will undoubtedly form a whole new niche of psychological study should enough humans survive them, but the question does arise for our interpretation, are we picking up a deep seated residual fear? Or perhaps an expectation of future disaster? If it is the latter, that certainly ties in with both the Antarctic and New Zealand specific geographic references emerging.

food & volcanoes

Our last lexical construct to be examined within Part 4 is headed by a primary aspect of [food] which is curiously populated with an attribute set all about [volcanoes]. Within this structure we find that [food] is going to be (sought) and will be (difficult) to [find/locate]. That much (anxiety) about [food] is or will be caused by [volcanoes]. That somehow, [volcanoes] will (press) [caution] upon the (search) for [food] or the [food] [industry] such that calls for [rationing], and [self-moderation/self rationing/self control] will be issued. These calls for rationing will be seen as (distractions) by those who are suffering the search for food, and will apparently not stop them from (acting/responding)(illegally). Further there will be some effort made to supply food to those searching for it, but the effort will be rejected due to [poisoning/corruption]. Also, an [underground] food store will be located, but it apparently also comes with (uncertainty) as to its [value/worth]. There are indications that the [poison] which is associated with the food is [natural] at least in so far as being caused by the [volcanoes]. There are also repeated earthquake references within the [volcanoes] aspect. These include [crust](broke)[open/split], and (widely)[open][sections](disrupt/tear/separate) [roads/roadways/paths/trails]. It could be that volcanic action triggers earthquakes which in turn cause significant transportation disruption which in turn leads to food shortages. Again, having too many geographic references we simply cannot pick out any changes which are statistically likely to be meaningful.

META-DATA/PROCESSING

Our data collection is complete, and the processing for part 5 of the data set is begun. This data set is very robust wherein each of the reads is coming back near our maximum processing limits. As a result, we will not get the number of reads we had hoped (in excess of 68 million), but in compensation, the total number of emerging changes is higher than we have ever encountered, so the 'richness' of the data set is very good. This will certainly produce a conclusion section for the report so we will go at least 6 parts.

As you may note, our processing is for the most immediate durational values in the beginning of the report series and going towards the 'long' end of things as the sections proceed. Part 4 represents a view of the 'majority' of the period seen, that is, a period likely to encompass the next 6 months, perhaps a little longer, but as it includes a summation of the progression through modelspace of the various entities, it also has some immediate capture as well. Part 5 will show us our farthest look 'out' yet. Though, again we must caution two things; our timing sucks, and the tsunami impacts on the data set cannot be underestimated. Further, we do not yet know and may not for years, if the impacts on the collective conscious discussions will be permanent as a result of the mega-disaster.

NOTE: The data set processed for Parts 2 through 5 is POST tsunami,   and therefore, earth focused with negative emotive sums is to be expected.

NOTE: while it is expected that tsunami language will appear   in our data sets the above references are forward looking. They have future-impact   value sums. However, we have no way to judge, at this time, just what level   of dominance the recent tsunami will have on our data sets other than to say   it will be significant. This data set is the first to be run which includes   post-tsunami gathering. This data set must be assumed to be dominated by that   emotional theme, and indeed is very coloring of the modelspace. Nonetheless,   we have made adjustments to the model to lower the visibility of the immediate   impact lexical sets so as to try to extract those which would be meaningful   going forward. No way of knowing if this effort will be successful.

Part 5 -BushCo - Frustrated Energy - Year of Failure, Weather - Continuum Change, USofA - Garlic and Rose,Dollar - Confusion and Yearning,   Meta-Data

Asymmetric Language Trend Analysis Intelligence Report
  Changes in language precede changes in behavior.

Data set distilled from 51.8 million reads.

BushCo - Frustrated Energy - Year of Failure

This section of the processing of data advances the modelspace   entities from the beginning of January through to the end of 2005. We note that   for January through the end of June we have some levels of detail, but moving   out through summer and the remainder of the year the detail levels drop dramatically.   This has to be seen as a 'meta-data' effect which is likely meaningful. We can state that this data stream detail clustering effect is also seen as we progress   the Populace entity through the modelspace. Several interpretations could apply.   One would be that the year will so chock-full-of-events that the collective   mind must narrow its focus just to cope. Another might be that while the whole   year, like any year, will be event-filled, the events which arise in the first   half of the year will dominate the year in toto.

The image that arises from the BushCo entity is one of (frustrated)   (expenditure) of [energy]. We find that like a [man] (surrounded) with (energy)   who is (unable/restricted/constrained) and is therefore (frustrated) by being   [out of/disconnected] from the times and [emotional tone/emotional flavor/collective   feeling] of the populace, so will the BushCo entity express its [frustration]   with (constraining/hemming/controlling) [circumstance]. This period is seen   as being flavored as (bewil-dering/confusing/obscuring) on both the BushCo entity   and, through cross links, the Populace entity. Within the Populace entities'   cross linked attribute sets which go back to BushCo we note that the Populace   contains [awake/realization] in juxtaposition to the BushCo's [intimidation/forced/coerced]   (exclusion), as though the continued forcing of the 'exclusion' of truth has   reached a point where the BushCo entity has started to (foster/nourish) (rebellion/resistance)   with each [utterance/statement/opinion]. Also within the Populace entity we   see a (rising)[resistance/response/reaction] to (shortage/ration/lack) of both   [words] and [foods].

Along with the idea of a [foods] shortage, we find within   the BushCo entity repeated aspect/at-tribute sets for the idea that BushCo is   to be (censured/called out/castigated) for [selfish/selfishness] and not knowing   when to (share/distribute) largess. This will bring out an 'echo' in the Populace entity which goes to the idea of [homegrown/grass roots/homemade](rebellion)   against (stingy/selfish/immature/hoarding). The BushCo entity contains [death/deaths]   within the attribute set hanging under the (castigation) as though it will be   blamed for deaths arising from the (inability/failure) to (adequately/correctly)   (distribute) something. The some things are to numerously identi-fied to be able   to pull out a particular. However, the image that comes through is a need arising for (staples/basics/fundamentals) to be (distributed) to large numbers of the   USofA {or perhaps American Hemisphere} population, and BushCo (fails) (in excess/in   large measure/excessively). We need to note that the primary aspect for BushCo, extending   out the rest of the year is (failure). We find that 'fail', and 'failing' and   'failure' are repeatedly surfacing as aspects, in active, high sum-mation emotive   mode, with completely filled attribute sets below. There are many areas in which this [wall] of (failure) will (frustrate) [energy] that BushCo desires to use.   In most of the attribute sets, the (failure) component cross links back to the   Populace entity where we discover that these attribute sets are replete with   references to (expose/exposure/reveal/revelation). Further, within BushCo we   find a mirrored aspect set around the idea of (obfuscation) (blocked) and [secrets](exposed).

Within our modelspace, extending from January to about mid   February of 2006 we note that there are large clusters of date ranges for the   BushCo entity. Indicative of an event filled year, we find cross links for the   financial entities to the BushCo entities which continue from January 30 through to June 6. In this case, these links are all below the modelspace neutral line,   and all are shading toward the top of the scale in emotive summation values,   though these are negatively weighted. Further we note a large spike for 'activity'   or action words as aspects for the dates of February 1, then the range of March   27 through April 17th with a minor drop in activity for April 4 through 9th.

However, the events of April 2 through April 4, seem to set the tone for the rest of the entities' progression through the modelspace in that we find a general downward, piling on trend, financially linked that will grow from February 1 through to the begriming of April. However from April 2 onward, even excepting the lull from the 2nd to the ninth, we find that the number of cross links increases rapidly as though a [dam/retaining wall](bursts/ruptures), and BushCo is (suffering)[inundation/flooding/drowning] in (miseries) of all sorts. In the lexical structures picking up from April 9 onward, we note that the aspects both secondary and sub primes, start referencing [shock] and (disbelief) (shattered). The image that comes across is that BushCo will do its usual 'fishing on the river of denial' with the fiscal crisis seen developing on or after February 1, but that with the beginning of April, will start to (breakdown/fragment) under the (suffocation) of multiple crises from multiple areas of past mistakes. Further, the language exists to suggest that (long dead/long buried/forgotten) (scandals/corruption) will emerge which will impact BushCo with a very large emotive summation toward 'public shame'. This language begins to appear in the March 27th time frame and extends on, building with some momentum after April 9, along with other areas of (broken)[ideas] and (misplaced/lost)[concern].

The timeline of (failure), primarily initiated with fiscal problems, extends out to June 6. Thereafter, apparently a period of (disharmony) and (cohesive)(rupture) occurs. This further impacts BushCo, especially as related to Populace entity, and we find a large lexical structure within the Populace entity which goes toward the idea of (irrelevancy) in so far as BushCo is concerned. This period is actually the 'good' part of the year for BushCo. We note that December 1 through the end of the year, and into 2006 as far as our modelspace extends, shows BushCo (thrashing) and (drowning) in (water) (too deep/excessive) which renders them (immobile/ineffective/without result). Further, (suicides) and (deaths) within BushCo will send Bush, and the 'leadership' of BushCo (reeling/ pitching/tossing) furthering both the (exposure/revelations) of (dried)[mud] and (powdered) [bones] which further increases the (isolation) and (withdrawal) of BushCo from reality. Apparently the real turning point for BushCo at an emotive level will be April 2 through 9. Thereafter the overarching image is one of (confusion) and (drunken/inebriation) as a response to the many (shocks) and (exposures) of (failure).

Along with the repeated references to (failure) as both an active state and as a modifier for a descriptor, we also note that more metaphoric lexical constructs for the same idea arise as in [brakes](removed) from (controller), and (dangerous) [position](next to)[accumulated][energy](frustrated) by [walls]. Again, in the same vein, [advance](further/again/ still/continues)[at great/magnified](risk). And [energy](unspent/not invested/not expended) [all](roads/paths) [blocked]. The whole of BushCo entity, when progressed through the modelspace, becomes involved with (failure). Where the failure is not an active, that is, current or future failure, it is referencing a past failure whose (belt) (for braking) is (removed) thus bringing the (explosive/hoarded energy) [forward]. Apparently, some of the (frustrated)[energy] will be (revealed) (before/in front of) (disbelieving/shaken/repulsed) [eyes].

The BushCo entity, as are all entities within the modelspace now, is dominated by the Terra entity. The BushCo entity has a number of (failure) cross links to both Iraq as in (continuing) to (punish) the [ignorant](child) brings [results] that are as [yielding] as [rock]. Those cross links back to Iraq speak basically to failure as an active, continuing 'bleeding to death by many cuts' kind of failure. There are no positive US to Iraq values which survive the processing. It is worth noting that BushCo cross links to Iraq include one which also cross links back to the Terra entity. In this case the lexical construct is suggesting that by the (end of/terminus/completion) of [summer], a weather event will (pull) the [arms] from the [body] and thus impact Bush's war in Iraq through (depletion) of the [blood]. The suggestion is that a weather event will cause such a demand for

resources that events in Iraq are altered.

Weather - Continuum Change

The nature of the weather event is hinted at in such aspect/attributes   as the (kettle/pot/pan) is (toppled). The [contents/holding/contained] are (spilt/spilled   out/dumped out) which produces (oozing) [wounds] to [intestinal/middle] and   (taints/poisons/influences/spoils) the [liver]. The weather event has several   secondary aspects going toward (wind fanned/wind blown/accelerated) [fire] (sweeps)   the [flatland]. Also seen within this structure are cross linked aspects back   to the Populace entity where they include (heard only) and (ears)[only/singly/restricted](contact).   Apparently there will be a [large/huge/excessive](noise/sound) with the wind   driven fire, and that further, apparently the fire will be affecting breathing.

We also find lexical structures much more indicative of   volcanic activity, but curiously, no references to volcano, merely [weather/climate].   Within these structures such as [breath] (conscious) (loss/lost/forgotten),   and (respiration)[control](loss/lost), we also find further cross links back   to the [shock], and (staggering) responses to (failure) within the BushCo entity.   The suggestion is that the official reaction to the weather event will not be   either well received or well thought out.

The weather event may also be a [continuum] rather than   a discrete point of a 'happening' of some sort. For the first time we are seeing   lexical indicators for [continuum] at a primary aspect level suggesting that   changes are perhaps emerging from a period of discrete instances of change into more of a period of continuous change. Further we find that the official responses   will be [shock] and (staggering) about, but that it will be the Populace which   suffers the [broken][feet] and is forced to (hobble/stumble), driven by (hot)   and (acid/acidic) [harsh] [winds]. The repeated references to chemicals in the   wind, while not specifically indicating volcanoes, do leave that impression. And as the primary aspect is the [weather] section of the Terra entity, it is   unlikely that this is referencing some form of chemical attack or accident.   Though, there may be some damage to chemical plants or storage places as a result   of the [weather] [continuum] [change] (acceleration) which is seen as being   fully (in place/settled/installed/resident) by the (end/terminus) of [summer]. Further, the [weather] aspect of the Terra entity suggests   that this weather change or event is global in scope and is either co-incident   with or related to a global [fisheries/fishing] problem which also arises. This   [loss] of (harvest) is seen as active, long term impacting with very high levels   of emotive sums, and very high immediate effect values. The former suggest that   this will not be a single season issue, and the latter show that the immediate   impact will, as indicated in the Populace cross links, (cause/initiate) [outcry's]   that (shift/move/relocate/rebuild) [governments/administrations/associations].   Further the [weather] aspect suggests that just as the [shock] of the weather event takes hold, the [fisheries](population) will (collapse/fall down) and   that [many thousands] will (seek/hunt) for [food] (below) and be (frustrated)   and [hungry/longing]. The aspects back at the Populace entity also cross connect   back to the BushCo entity on the [no/not/none/absence] of [success] aspect/attributes   and is so cross connected for both the [fisheries] collapse and the [weather]   continuum change. Further, the Populace entity has aspects for [shock] which   are fully completed and whose attribute set contains numerous references to   [broken] [feet] and the impact of the [inability] to walk. It would be most   likely that these attribute sets relate to the impact of the [weather] continuum   event and perhaps indicate it will severely impact global transportation. We do find a number of references {61090} within the Populace entity which go to   the idea of 'global' in scope and nature. These numerous references within Populace   entity are also seen within the Terra entity both connected to the [weather]   continuum, and the [fisheries] collapse. In a number of these global scope focusing   constructs, we also find that the global impact extends beyond the end of the   year.

Also in the Terra entity, and in the global scope lexical   aspects, we find explicit references to [crust]

of the [earth] (is/is being)   (broken)[open]. Of course the reader is cautioned that this report is generated   from data which is post-tsumami and such references are to be expected. That   said, it does arise, even after filtering, that the emotive 'expectation' is   there. The values for the emotive sums are consistent and high, and go through   to merge with the continuum change aspect of the weather aspect of the Terra   entity. Within the 'earth crust breaks open' we also find a group of cross links   which go back to both the Populace entity and self-link back within the Terra   entity to the [fisheries] collapse. It is these cross links to the fisheries   problem which makes the 'crust breaking open' more than merely an 'escapee'   from our filtering. The supporting words for the fisheries collapse also have,   when summed, a connection back to a structure which reads that [earth](moves) and [food](below) is (crushed). Within the (crushed) attribute set, we find   that [bits/pieces/sections/parts] are (distributed/scattered/spread) [world-wide/globally].   The [fisheries] collapse, or (injury) to [existence] is just one of several   aspect/attribute sets which are food related.

Within the Populace entity, and extensively cross linked   back to the [weather] aspect of the Terra entity we find a number of references   to [food] (shock), and [food] (delivery)[coagulation]. Within the Populace entity   these references are supporting lexical structures which go to (frightened), (fear), (shock), (fear)(shock) (induces) [new][laws]. These new laws are also   supporting lexical clues that they will be [useless] and this in turn, is cross   linked back to the BushCo entity and connects at the active (failure) aspect.   Further, the [laws] in (response) are (distractions) (during) a [feast] of [death].   Also, within the Populace entity, and cross connecting back under [numbness] and (shocked) to [insensibility] we note that the [food] delivery failures which   are apparently [weather] caused, will be inter-twined with the other aspects   of [weather] hitting the Populace. These include [powerlessness], [shock],[horrors],   as well as (empty) [battlefields] which (stink) and leave on [out of breath]   and (trembling) from [mental](exhaustion). While this last bit is anyone's guess   as to meaning it is apparently meaningful as it is repeated, albeit in slightly   different form, within the Terra entity and again, referencing [wind] as a component   of a [weather] [shock]. Within both the Terra entity and the Populace entity   as regards the [weather] continuum change, we find bespoke references to [fear],   [frightened], (scared) into [inaction/immobility], and [fear](ebbs) like a [tide](washing)   over the [land][people]. This last could also be seen as 'lands and peoples'   as there are plurals within the attribute set. A large component of the [fear]   shock related to [food], but not explicitly under or cross connected to the   fisheries issues, is connected to geographic descriptors for [pacific] as in   ocean, rather than emotional stance. We note a five times standard deviation   on geographic place names related to the Pacific Ocean basin. Further descriptors   for the [food] delivery problems include the curious [skin](loss/lost), and   a very large group going toward [winds], and [noise/thunder]. As for timing,   we find that the first impacts of the [foreign/outland/stranger] [food] problems   will surface with the [change/arrival] of [spring/equinox] and these [pressures]   of [failure] (exaggerated/magnified) by [harsh] and [fear-laden/fear constrained/frightened]   [words] will build to the crisis point by end of summer.

Further, as was indicated in the previous report, we find   that [red][skin] and [respiration] and [circulation] will be impacted by the   [sun] (disease) such that the problems with [food] [sources/resources/origination]   are (compounded) by [subordinates] (turning/running)[red] with [effort/exertion]   and [fear] which in turn causes many to [retreat/hide/shield] under [cloths]   (all) [daylight/sunlight/daytime]. Apparently at some point in the whole stew   of problems, a report or news article will [paint] the [fear] of BushCo to the   populace shut that [assaults] and [riots] disrupt (pretense) at [work] and send   these same [red] [subordinates] (fleeing) to [holes].

Back within the Terra entity, and still under the [wind]   driven continuum changes, we find that [new] [rivers/waterways] will be created   from the [fertile] and [docile] [earth] as the [waters] of the [Pacific Ocean]   are (raised) and (released). This appears to be indicative of further, large   storms

as we see that much of the references within the structure still go toward   thunder, rain, and lightning, with little to no mention of waves. There are   frequent references to [danger/dangerous/risk/risky] as well as repeated references   to (difficulties) in (walking) (away) and trying to find [paths] for [refugees]   to cross [rivers] and [mudflats]. These are evocative of flash floods and mudslides already seen this winter along the West Coast of the USofA and other locales   in the Pacific Rim countries, but these references are all forward looking in   emotive sums, with the interpretation being that the events here are to be realized   this summer when we are presented with an [out of season/unseasonable/irregular/non   periodic] summer of [rainstorms].

The Terra entity, conjunct with its [weather] continuum   change aspect has a primary aspect for [sun] with indications that (seeing/looking)   at the [sun] this summer will be [unshielded/bare/stark/raw] and that (gazing)   at it (directly) will produce [marks] on the [body] and the [mind]. Further we find odd references to [people] (hiding/shielding) under [leaves] and [gourds/squash].   Also there apparently will be 'official' pronouncements to 'order the avoidance   of looking at the sun' and that these will be particularly aimed at children.   Further, there are references to some form of [device] for [navigating] while   (walking) such that one can be (guided) by [shadows] rather than [sunlight]. Perhaps this is indicating a more general approach to traveling at night due   to solar problems in the day. Again, just a note that this lexical thread also   cross links back to 'numbness' within the Populace entity.

One further note about the [weather] continuum change aspect   is that we find two separate threads indicating that the changes occurring within   the atmosphere will touch the nature of the atmosphere itself, that is, making   it (difficult) to (breathe/live) at [altitude] such that (migrations) begin   this summer. Curiously there are indications of migrations both from 'lowlands'   up into the hills, and vice versa. Both are related to the atmosphere and breathing.   In one case we find explicit references to (too/excessive) [hard] (breathing)   at [high/upper/top] [altitude] causing people to (pick) through [stones] (slowly)   [downhill], while also finding that [dense] air in the [low lands/marsh/estuaries] (drives) [herds] (up land/up hill).

As has been noted above, this data gathering period includes   the immediate aftermath of the Indian Ocean tsunami, and therefore it is to   be expected that we will see the lexical shifts shade toward earthquake, water,   and other related ideas. Since this was expected, we put filters together which went to the idea of 'flattening' the impact of these lexical shifts on the data.   Not that these were screened out, but rather that the concepts were 'under-weighted'   within the samples, and with some reasonable expectation of success, we hope   that the 'spike' of lexical changes would be reduced within the modelspace.   Again we note that while this may indeed have been accomplished, we nonetheless   found that our modelspace was dominated in all respects by Terra focused word groups. Further that these were negative in general, and ubiquitously so. The   net effect within the model has been to 'push down' or 'weigh down' all the   entities with many now below our neutral point and into negative emotive value   territory. Some of these structures no longer have any parts extend into positive   parts of the modelspace. Those references to the USofA are among this group.

USofA - Garlic and Rose

Also noting that our data rarely give good clues when dates   are involved, we have to note that both April, and December are showing up very   prominently within the USofA focused lexical groups. These aspects and attributes,   while containing a large number of dates and date ranges, show very large spikes   for the first few days of both April and December. We also have a secondarily   large group of date ranges showing up which will affect the USofA over basically   the entire summer. In this latter case, we note that much of these aspects go   toward the financial, with specific references to [housing/shelter/residence].   Further, while residence appears within the aspect set, the predominant theme   is repetiously [shelter] as in [shelter] (from the) [storms].

As to the April references within the USofA structure within the Terra entity, we note cross links to the [rising] [land] reported in earlier parts of this ALTA run, but the primary aspect/attribute threads go to the idea of the [ocean] (flowing/rising/moving) into the [rivers]. Specifically we note that many of the aspect/attribute sets contain either references to [reversal] as in [reversal] of (flow), or go to that concept. The image that repeated emerges is that large areas of [surface] of [earth] will be covered as [waters] of the [ocean] (flow) (wherever) (together) and (cover) [rivers] with [ocean][waters]. Further, while the majority of the location aspects are for the USofA, we also note that apparently this is not restricted to the USofA and that large areas of South America are also under threat of inundation by ocean waters. Within the structure going to the (rising) of the [ocean][waters] we can note that apparently things move slowly enough that [herds] are (driven) (before/in advance of/ahead of) the [waters][edge/front/leading]. So this would appear to NOT be a tsunami sort of event, but much more like very atypically high tides which breach river delta limits and force flooding further up the rivers.

We also note a curious linking of the [flooding] with BushCo which apparently will be having some form of [shock] crisis about this time, and that BushCo will be undergoing some form of [transform/change] as its [face] is (denied) [access/respect/viewing]. This latter is curious, and is also supported by several indicator of a [hardening/rigidification] of the [lies/deceptions] which within BushCo, starts up following events in April, and rises to dominance from May through November. Apparently, just as BushCo is 'getting over' or beyond the April events, the first part of December brings yet more problems both to the USofA and to BushCo. In the case of BushCo, the [administration] is seen as being [hobbled] by [fighting/strife] and is seen as [inconsistent] with its [sincerity] in the face of [disasters]. Its [caution] in [movement] leads to its own problems internally that extend out as far from that point as the modelspace contains lexical references, perhaps to July of 2007, though we note the date range references drop off as we extend the modelspace forward. Nonetheless, it would seem that the flooding in the Americas during April, seen as both [ocean] and [rainwater] caused, and subsequent events within April will exacerbate the situation politically for BushCo and [shock] BushCo shut that [faces] are (seen) which should have (remained) [buried/ hidden/disposed of]. And further that an other disaster(s) to arrive in very early December, whose primary aspects include [death] in [plentitude] as well as [disease] and [misery] strike at a time when BushCo is occupied with its own [death] aspects, and (weight) of the [dead] such that [effectiveness/ability/capability] is (shattered) and (lies) (long dead/deeply buried) [surface].

In returning to the April flooding, we have a couple of curious aspects including [garlic] and [rose] which apparently will (overlook/over see/gaze down upon/supervise) the [herds] (fleeing) the (rising) [waters]. These references might be indicative of a place where both garlic and roses are grown, or more likely come along with the spring indicators which cluster around April. In any event the [plants/crops] will have some issues of their own as the [waters] are seen as (rising) to [fill] the [empty] [places] which (separate) and (force/drive/direct) [people/populace/city] into new [communities] which in turn are (isolated) and (nearly/almost/partially/mostly)(drowned). A series of number values arose in the early part of the processing which we never trust as numbers litter the data source and are mostly meaningless, nonetheless, we present them here as they arose and that is [ten] [men] [tall]. Specifically it is not referencing 'ten tall men', but rather 'ten men tall'. Now note that globally we have an assumption for the 'standard' height of a man at five/5 feet. This would place our flooding heights at around 50 feet. IF THE NUMBERS are meaningful, which is doubtful. Again, in our allegorical processing, we may merely have run into its way of saying 'many' or 'much'.

Noting that we have the Terra entity also containing references {in previous part of report} to two cities facing [ruin] this year, it may be that we see something of this nature in April. What we do see

is many, duplicated,   doubled, and cross linked references to [rainwater] (hovering) over [earth] like [blankets] over [fields]. Further that the [oceans] will (rise) on the   [knees] of the [land] and will (push into/invade/over flow) the [boundary] of   the [river]. Again, noting the tsunami impacts on our data we can say that this   does not seem to have the violent character of the tsunami, and the images coming   from this are more of a two pronged assault in which rainwater pours down while   oceans slowly flood inland.

We also need to note that the geographic references are   for the [south east] when linked to the USofA, though not exclusively, merely   dominant in numeric terms.

Following the April references and covering that period   through to end of [summer] with some level of detail, we note that [excessive](energy/radiation)   is seen as (falling) on the [earth] from the [sky] which will lead to its own   problems. We find that the excessive energy will cause or participate in the   [sun][disease] seen in earlier sections, and will cause some form of (cover/cover   up/ deception) to emerge from BushCo which (unravels) as they [knit] it.

We can also trace a lexical structure from BushCo back through   aspects of a [man] (outside) of [events/circumstances] back to the Terra entity   where we see that the April [flooding] will include [rain] caused (damage/destruction).   In this lexical construct we also find cross links back to the [oceans] (taking)   [great/large/huge] [measure/amount] of (possession/control/ownership) of the [land].

In the case of the [rain] induced flooding, there are indications   that the amounts will be exceptional and will (scrub)(down) the [extravegant]   [features] to [bare] or (worn) [nubbins/outcrops/stubs/ stumps]. And that the   [rain] will be so intense as to (fiercely) (bounce) [back], and that in some places will create an (un breathe able/non respiratory) [foam].

Dollar - Confusion and Yearning

Also cross linked and threaded through the BushCo entity   are the lexical threads referencing the financial structure of the globe. As   the USofA dollar is the global reserve currency, we note that global terms,   and references stream in with any and all dollar references since so much of   the planet is discussing the dollar. Also of curious note is that in the late   1880's, prior to a vicious paper currency crisis within the USofA, almost all   newspapers of the time featured daily stories on both currency and the governmental   structures necessary to support a paper currency. This situation is being replicated   within our data sets. Intimately tied to BushCo's [misery] lexical thread are   the primary threads representing the dollar. We note that these have dropped   below the neutral line within the modelspace as of February 1 as indicated in   earlier reports on this data, and that they continue below that line as far   as we are able to progress the modelspace.

Further that the dollar references are clumped up with 'hope   full' emotive summation values, but these are all in what we term 'cul de sacs'   as the lexical structures, while complete, are totally contained and without   cross links within their attribute sets. In the past such structures have been successfully interpreted as 'pious' hopes that are forlorn, or doomed from the   start as they fly in the face of developing reality.

Apparently, in spite of (desires) for [fiscal](unity/merging/cohesion/agreement)   we find that [arrogance] is (unable) to [achieve] and that [confusion] and [yearning]   become the dollar watchwords for the period. The suggestion is that [pundits/proclaimers/directors/reporters]   will (pine/yearn/ desire) the [return], but that [practical] (distrust) of (blandishments/flattery/lies)   for (unity) of [purpose] will be met (without) [faith/belief]. These attribute   sets are cross linked both to the Populace, where they intersect with (cries)   and (sighs) of (lament), and with the Terra entity where a dominant theme of   (moans) and (groans) houses the cross links.

The dollar is seen as a driving force for [discussion/news/reports]   through the [summer] and will apparently generate discussions about its demise.   The aspect/attributes indicate that at some point

near the end of summer it   will be seen as (best/finest) to (relieve) the (suffering), and let the dollar [death](croak). The emotive summations are ambiguous, that is, of equal weighting   so it is possible to interpret this as a discussion about an event already happening,   or a discussion about the possibility of the event happening. No clarity exists   for an easy determination.

A grueling part of this ALTA run is the very heavy cross   linking of dominant aspects among all entities with most entities primary and   secondary aspects linking back to the Terra entity. So in noting that the dollar   'death' discussions are seen as occurring through out summer, we also note that   at some point two large cities are seen as having disasters, as well as 'communities   being isolated by ocean flood waters' and that these Terra threads are directly   cross linked to both the dollar lexical identifiers as well as being heavily   linked back to BushCo. When we represent the cross links with black lines within   the modelspace, we end up with a mostly black surface and only a few points   of discrete color. This could be indicative of 'all hell breaking loose' in   the sense of many different challenges throughout the year, or it could be the   impact of the Indian Ocean tsunami on the global discussion during our data   gathering. As we cannot filter out all of these possible impacts, it makes sense   to interpret along the lines of multiple points of inter-connected challenges emerging this year which tie the dollar to poor decisions from BushCo at a point   where natural disasters and conditions further aggravate both circumstance and   decisions. In this vein we note that some form of crisis in [income] which has   [tax/taxes] associated with it is also bound up in the whole dollar - disaster   - BushCo stew. It is not possible to detect which way the 'flow' of the problems   go, so it could be that crisis in [currency] (creation/resource/source/supply)   creates problems in providing (help) for those affected by the flooding, or   perhaps it is that the flooding either impacts [tax] collection or other income   stream such that the natural disaster is compounded by a fiscal disaster. The   primary aspects for [disaster] are present in both cases and both have equally weighted emotive sums of the same value. Further, the impact on the dollar as   currency is at a -4 for 'carry value' and as such is seen as extending to the   end of the modelspace advancement of approximately June of 2007.

META-DATA

There remains a large amount of data to be processed, about   9 million reads. However, the timing material within the data collection is   about at the limits of our modelspace. That is, these remaining 9 million reads   are likely already outdated or superceded by the time having passed their 'carry value'. We will prepare a part 6 of these report after processing this last   data volume, but we do not expect to find anything of note, and the part 6 may   merely be summary information and some smaller entities that bear examination.   We have to provide some summary data sets to the primary support members of   this report which will take a few days in processing so we do not expect to have Part 6 ready until February 6 or 7th. Again, it is likely to be mostly   'old news' so to speak.

On our meta-data notes, we find that our ratio for discussions   of UFO's is still up and rising. And as may be predicted we have a whole new   'class' of continuing conversation discussing earth-change related matters.   A rising element within this area are discussions and articles about 'earth   rotation' and 'extra-planetary influences'. We also note that within English   speaking data sources, 'natural disasters' has now topped 'terrorism/Bush's   war in Iraq' in total volume, even in spite of the Iraq elections and the discussions   that it sparked. The 'natural disasters' discussions now over weight terrorism   nearly 3 to 1. Whether this holds remains to be seen, but, if the indications   for the bad weather actually materialize, then likely the ratio will hold and   increase.

ADDED after posting on January 30, 2005

Sorry about that, but a brief note was left out of part   5. What we intended to include within the Meta data section was that 'earth   noises' are showing up as the subject of conversation. Much like we saw the   ringing in the ears discussions arise prior to the tsunami, we can now note   that in 28

languages, people are discussing 'mysterious' goans and moans from   the ground. Within the conver-
sations these are mostly unexplained, and under   several different descriptors. That is, depending on
local language influences,   the description of the noise varies.

These noise reports are coming from SE Asia, central to   south South America, southern Europe,
and within the US and the Carribe islands.   There is also a thin strip of information indicating the
same sorts of noises   are being reported out of the Kergiz Steppe in Kazakstan.

Within the US we find these reports have several large clusters   which group around a 'T' shape
whose top bar extends from New Orleans, LA, up   to Denver. The long part of the 'T' runs from this
line east of Texas up through   the Indian River valley toward Lake Erie.There are two clusters of
size outside   of this 'T' shape, one of which is near Montreal, and the other north of Edmonton,
near the Lesser Slave Lake region.

The descriptors for these 'earth noises' range from UFO   like, to 'underground trams', to 'trolls
digging', to 'horses running'. In all   cases the noises appear to be first heard at night, but they are in
the main,   multiday events. In some references these reports persisted the entirety of   the data
gathering period.

This information is beng pasted to the bottom of Part 5.

ALTA IR - February 5, 2005 - Part 6

NOTE: The data set processed for Parts 2 through 6 is POST tsunami,   and therefore, earth focused with negative emotive sums is to be expected.

NOTE: while it is expected that tsunami language will appear   in our data sets the above references are forward looking. They have future-impact   value sums. However, we have no way to judge, at this time, just what level   of dominance the recent tsunami will have on our data sets other than to say   it will be significant. This data set is the first to be run which includes   post-tsunami gathering. This data set must be assumed to be dominated by that   emotional theme, and indeed is very color-ing of the modelspace. Nonetheless,   we have made adjustments to the model to lower the visibility of the immediate   impact lexical sets so as to try to extract those which would be meaningful   going forward. No way of knowing if this effort will be successful.

Part 6 - Section 1 - Populace - Bad Luck and Injury, Currency - Out and Out, South America - Thunder from Below, Antarctica - Blood Flows,   USofA - PNW - Flutters

02.05.2005 Populace - Bad Luck and Injury, Currency - Out and Out, South America - Thunder from Below, Antarctica - Blood Flows, USofA   - PNW - Flutters

Note: Entities are identified by a blue   typeface. Aspect words are enclosed in square brackets []. Attribute words/phrases   are within parentheses (). Interpretive editorial comments are preceded by an   asterisk *.

Data set distilled from 60.2 million reads.

Populace - Bad Luck and Injury

The Populace entity, understandably dominated by the recent   tragic events in the Indian Ocean, and still under the 'cloud' of the Terra   entity, has a curious central aspect on which most of the primary aspects hang,   this is (injury) as an active aspect, backed up by [bad luck] as the passive,   past tense effective form of the (injury) data set. This central aspect runs   the length of the Populace entity out to the end of modelspace, but its bulk   of emotive sums have carry values clustering about the March through June period.   Noting that frequently our timing clues are wrong, we nonetheless find that   the [bad luck] begins with a period in which there is a central theme of (very)[important] (small)[matters/things/items] which are (pressed) into (continuance) (long after/beyond)   (reasonable) [need]. Again this is reinforced within the attribute set with   [press] [on and on/continuously/ extended] (leads to/incurs) [bad luck](injury)   and again, within the secondary attribute sets we note that [press] (on and   on) (invites) [retribution/misfortune]. We also note that a cross connected nomative descriptor shows as being central to the 'pressing on and on' is a   [deviant] personality. Under some [exceptional](situations), likely [two/2], we   will see that [temper] is (not)[checked/ held/restrained] and in spite of (precautions)   (against)[danger] there will nonetheless be a [wounding/penetration/attack].   The nomative descriptors indicate that [women] in (disguise) {note that active   disguise is implied} will (breach) the [temple/public building/courthouse/atrium]   and that a (situation) will arise in which our [deviant] personality will (cry   out/yell) (too/excessive) (loudly), apparently [unaware] of the [danger] of   the (situation). Misfortune or [wounding] will take place, and this [wounding]   will be (moving/motivating/occupying) the Populace entity for some months. Also within the Populace entity, and marking a significant   debut as a substantial area of representation we note the emergence of a large   thread devoted to the [media]. In this case it now appears that in a whole new   way, [media] is occupying a portion of the consciousness of the Populace entity.   Within this lexical substructure, we note that the Populace entity offers that   the [media] will next be moved or (directed) by its own sense of (placid)[satisfaction/contentment].   This 'placid contentment' structure points out that the [media] is going to   go through a 'rough patch' in the near future. We find that the rough period   will begin with (over-indulgence/excessive consumption) in which [small](pleasures)   are (desperately)(sought). And that during this period, the [media] will be (insatiable) and will (eat) its [own/like kind/same as].

But, within the Populace entity cross connected to the [media]   sub structure we note that [empty][within], [hollow], and (devoid/empty of)   are the ruling aspects indicating that the media's insatiable nature does it   no good in so far as its consumers are concerned. In fact the attribute sets back up the [empty][within] and (no thing/nothing/no part) (satisfies/completes)   theme. We also find that the [media] is the (servant of/slave to) [grand][imperial](ambitions)   which are (not) [restrained] and this part of the attribute set cross connects   to contribute to the whole of the [misfortune] and [wounding]. Apparently the   [media] will continue to (play) its [game] up until the early part of April   {4 through the 9th] and at that point, the [media] lexical thread suggests that   (arrogance) will (drop) like a [stone] in a [lake] due to (lack) of [pleasure]   (to be/can be) [found]. One way to interpret this would be to suggest that come   early April, some very negative news makes it impossible for the [media] to   continue to offer 'trivialities'. Further we note that the (disintegrating)[influences]   will cause the [media] to (revolt) or to join an already emerging [rebellion]   which is indicated within the Populace entity. In any event, at that point (deceptions)   are (uncovered) and the [media] is viewed as a (betrayer) of [trust]. Curiously,   also within the [media] sub set we find that the [media], collectively, will   also feel as though they have been [betrayed] by those in whom they placed [trust]   and they in turn will (align) their [words] with [deeds]. Also of note, the   April indicators within the Populace entity are hung off the aspects of (severe)   and (sudden)(jolts/shakes/shake up).

We also need to point out that one possible area for the [media] to be inappropriately selling 'placid satisfaction' as their staple fare is within 'earth changes' or 'climate change'. We find repeated references and doubled, cross links between the Terra entity, sub section [weather] and sub section [alterations/changes] and the Populace entity, sub section [media] and right over to the [calm] [waters] sub aspect which goes to the 'placid contentment' aspect/attribute set. This is not to say that events in April will be Terra entity events, but given recent past performance of earth, it would be reasonable to project that this has a significant chance of being a motivating area for both the Populace entity as a whole, and the media sub element.

Currency - Out and Out

Along with the running theme of 'bad luck' and 'injury', we find a cross connected thread of aspect/ attribute sets which cover the area broadly defined as the [currency] markets. This area, while dominated by words relating to the dollar is not specifically dollar focused, and instead may be seen as the whole of the markets for currencies. Within this we note that the primary aspect arising is [out and out/actual/physical/undeniable] (decrease/reduction). Further there are clear indications of a (one third/one out of three) amount to the reduction. It is as though we are speaking of deflation without using the word. In this case, it would appear that the Populace entity is saying that an actual one-third reduction in those things which make for material wealth will take place and that this decrease or loss or reduction will (hit/impact/strike/shock/jolt) the [currency] markets into [reality]. Also cross connected to the [media] sub set at the point of [increase] by [ten] (times/fold) the [words], which may indicate that action in the currency markets due to the (sudden) (jolt/shock) of a large (decrease) causes the media to devote some serious level of verbiage to the new situation. However, the strongest theme to emerge from this sub set is that, external to the currency market itself, some large decrease of the actual wealth will be the cause for reduction in the values of all currencies, but with the dollar leading the way.

South America - Thunder from Below

Within the Populace entity, and cross linked back over to the Terra entity at the point of the geographic reference aspect for South America, we find that the primary aspect is [thunder](from below). This primary aspect has as its main attribute set [shock] from (below/under) [serious](situation/occurrence/time) creates (alert) [attitude]. Further this aspect also contains attribute sets which in turn contain [door](opens) to [embark] and [pressure/pressing/force] from (both) [opposites](below) and (above). We also see within the thread that [previous/earlier/ first](fear) (sharpens/shapes/focuses) (action) and (response) which produces a largely [joyous] outcome. One interpretation might be that the continuing earthquakes and shocks in the region lead to a fear based, heightened state of alertness which allows those affected to quickly realize the seriousness of what will apparently be a large shock, and this attitude of awareness brings success in avoiding a bad response.

We note that Terra linked [fault] {as in earthquake fault}, will be (recognized) for its [true] nature or [import] and a (way) [clear/free] will be (available) and (embarked upon/taken up). We must also note within this structure the cross links back to that part of the Terra entity seen within the earlier parts of this ALTA report in which 'rising land/earth' was seen. Again, within our modelspace, this 'rising' earth is seen as generating 'terror/fear/shock', but that (previous)[exposure] or [occurrence] has (dampened) the fears. The [fault] within the Terra entity also links to the Populace entity at several sets which also indicate [rise], [lifting], and [stepping](upward).

Antarctica - Blood Flows

Also within this recent data addition, and representing the last of the data set scooped and therefore the most recent of the data, we find a statistically significant increase in references to Antarctica, and Australia, and New Zealand. Further, smaller increases are also noted for Tierra del Fuego

and Patagonia. In the case of Antarctica these references are associated   with aspects such as [benign/warm/comforting](winds) (begin) [rhythmic](motion/movement).   However, contrasted with the benign reference we find several aspects/attribute   sets which are headed by [red] or (fiery) [blood]. In all cases within the attribute   sets we find (flow), and [blood](flow). Also we note that (movement) (is not/will   not be) [fortuitous]. Again, within the recent data, and sub aspect of the [red][blood](flow)   we find that Antarctica will (drain) and (produce/create/cause) a [smell/odor] of (putrefaction/rotting). One interpretation is obviously that volcanic action   will cause some ice movement which would likely reveal old vegetation or bacteria   which may indeed stink. This (dying off/extinction) which is [cold/ice] focused,   also has curious links to (extracting) [all/every] (energy/force/heat/light)   from (earth/ground) which apparently goes toward the (movement) of the [ice]. The obvious interpretation is that volcanic activity on Antarctica escalates   to a serious level which induces ice movement on a grand scale.

Also Antarctica associated we find complete aspect/attribute   sets repeating the idea of [transformation] and [change]. In these attribute   sets we find cross links back to the Populace entity {ed note:and previously   reported BushCo links} where we note that the [transformation] of Antarctica will cause a mood change within the Populace. The Populace entity cross links   back in such a way that a distinct change in emotive sums occurs as a result   of or co-incident to, the changes seen arising in Antarctica. Within the Populace   entity the mood shift also is tied over to the [media] changes. In this case   there is no way to discern whether the [media] impact is related to this Antarctic   change precipitating a general mood shift in the populace. It is necessary to   note that both the media change and the populace mood change happen subsequent   to the Antarctica [transformation]. In the case of the Populace, the indications   are clear that [no/none](joy) comes and that [oppressive] (airs/vapors) [weigh]   down on the Populace. These vapors might be real vapor or gasses, but could   also be interpreted as an [oppressive][mood]. The lexical structures are not   clear in this regard.

USofA - PNW - Flutters

Cross linked back through the geographic references to the   [transformation] within the Antarctic, we find a series of rising values for   geographic references along the west coast of the USofA with the highest number   of references going to the Pacific NorthWest section. Nonetheless, all of the west coast will apparently (pull) in [harmony/simultaneously] with the Antarctic   [transformation]. Within the PNW we find that (runners/veins) will [open/expose]   and that (uprooting) will take place as the area is (pulled) (toward/to/in the   direction of) the [exterior]. This last is a bit curious, it is indicating through   its attribute sets that [exterior] is referring to [up] or [away] (from) the   [fire] of the [earth]. We can also note repeated references to (early/soon)   [spring] being [out of season] and that the (opening/releasing) of the [veins]   will (bring) the [neighbors] (running) with [aid/succor/help]. The [surcease]   offered will be welcomed, but seemingly will be (premature/early) as the [echo/resonance/reverberation]   will prove to be (greater/more) damaging than the initial [reaction] to the   Antarctic [transformation].

Not to be alarmist, but the PNW indications include specifics   such as (fording) of [rivers] (required) in [absense/lack of] [bridges/connections],   as well as [public/masses](walk) to [middle]. Further sub attribute sets within   the [neighbor] aspect {eg. those who come to help} also show that they will be (forced/compelled) to [walk] or (attempt) to [walk] and that both groups   will have to (encounter/live with/survive) [flutter/spasms].

The [flutters] also cross link back over to the Populace   entity such that these links go back to the BushCo entity. The suggestion is   that whatever these [flutters] turn out to be, that this will cause some level   of (required/necessary/needed) reaction from BushCo. Also we note that the descriptor sets for the [flutters] include attributes such as (down) and (from)[above]   as well as (descends) on

[our/plural possessive] [heads]. This may well be interpreted   as being some form of 'ash event' from one of our local volcanoes in the area   which is triggered by changes in Antarctica resulting in a general need for   assistance.

NOTE: The data set processed for Parts 2 through 6 is POST tsunami,   and therefore, earth focused with negative emotive sums is to be expected.

NOTE: while it is expected that tsunami language will appear   in our data sets the above references are forward looking. They have future-impact   value sums. However, we have no way to judge, at this time, just what level   of dominance the recent tsunami will have on our data sets other than to say   it will be significant. This data set is the first to be run which includes   post-tsunami gathering. This data set must be assumed to be dominated by that   emotional theme, and indeed is very color-ing of the modelspace. Nonetheless,   we have made adjustments to the model to lower the visibility of the immediate   impact lexical sets so as to try to extract those which would be meaningful   going forward. No way of knowing if this effort will be successful.

Part 6 - Section 2 - ISS - Whew, that was close, Levantine to   the Hind - Bad Moon Rising, Water Damage - February 20th, Wind and Fire Damage   - July 20th, Conclusion

Asymmetric Language Trend Analysis Intelligence Report
  Changes in language precede changes in behavior.

Data set distilled from 60.2 million reads.

ISS - Whew, that was close

Within lexical sub structures, smallish groups emerge sometimes   which are fully populated in the

sense of having complete aspects/attribute   sets with all the emotive summation values being calculable. These are miniature   entities and occasionally are very accurate, within the fuzzy scope of what   we can render from them. One good example {housed at Geo. Ure's site, urbansurvival.com} is the East coast power outage prediction. Within this run, we find a number   of these smallish mini-entities to consider.

One of these entities with the clearest of indicators is   being called ISS which is short for International Space Station. Within this   structure we find references to an [accident/misstep/misplaced action] which   will take place within the context of (risk) of (catastrophic/fatal/complete/final) [failure]. Somehow, this will have an [italian/italy] connection, and during   the playing out of the [accident/mishap] the [error/mistake] will be made.

Apparently there will be circumstances which present [danger]   to (life) and that there are several options available for action. The (wrong/incorrect/inappropriate)   action will be taken, but, fortuitously, (disaster) will be (avoided) in spite   of the [mistake]. In this structure we can note that the person who makes the   mistake will not even be called to accounting for it, as they will apparently redeem themselves by recognizing the mistake and taking, (secondary/after the   fact) [remedial/corrective](action). In the structure it is seen as a 'save'   of the situation which results in the persons involved being (praised) [rather   than/instead of/alternatively] (censured). The risks due to the accident or   situation will be ameliorated, and the mistake rectified, but nonetheless, (strains/stress/tensions/energy)   will be seen as requiring (massive/large/huge) [defense/barrier/shield] in order   to (secure) the ISS. The lexical structure within this run suggests that such   a massive effort will not be seen as feasible, and the ISS will be abandoned   while in a 'broken' state. The many references to (return) and (recapture) suggest   that at least promises to go back will be made, though there is no indications   that this will occur this year. The only date range associated with this structure   shows for late March and into April. It must also be noted that apparently,   this period of late March {the 27th} through April 9th will be just chock-full-of   all kinds of news, and as such, the ISS story is seen as a minor background   player in a field full of other, perhaps, more pressing items.

 Levantine to the Hind - Bad Moon Rising

Also associated with the late March period, we note a large   structure which rides between the Populace entity and the Terra entity like   a commonly held basket. Gripped by cross links to both entities, and yet really   part of neither, we have decided to name this for its geographic range which extends from the Levantine crescent edge of the Mediterranean {Syria, Lebanon,   Israel} over to the Hind {the Indus river valley regions on the western edge   of India}. Encompassing what the west thinks of as the Middle East, but also   the western side of India and the Arabian Sea, this structure does not include   references to either Turkey or Egypt. It does include Iran {as greater Persia}   and Afghanistan, and Pakistan, Kashmir, and western India. Further there are   references which extend down the Indian western coast, but these do not round   the Malabar Coast.

Specifically, it would appear that several power struggles   will play out during this period. We note that references to Iraq include the   (massing/gathering) for [passe-de-duo/second strike/counter strike] which is   seen as causing the [black][blood] [face] of BushCo in (frustration) and (rage)   at (impotence). Further, as the situation continues to unfold over the month   of April {primarily, more references to April than other months}, we note that   the [countenance] of BushCo will (alternate/cycle) between [black] [blood] and   the [pale](empty/drained) face of (fear).

It would also appear from this structure that the area will   see many power struggles all popping off more or less at once which will produce   a seeming [stew] of 'news' of [warfare] and (reprisals). As this whole period   is centered around the new moon of April, it really does appear that for this geographic area, this will be a case of 'bad moon rising'.

Several oddities arise within this mutually held structure   as cross links over to the Terra entity

suggest that much more in the way of both (earthquake) and [earth/ground/firmament] (movement/ step/shift) will also be involved. Further there are indications of [seasons] (denied/repulsed) as though the climate becomes 'off'. The lexical clues including the emotive sums for the structure at both aspect and attribute level suggest that somehow these 'climate irregularities' become involved in the [warfare] in the region. In one aspects' attribute set we note that [climate] (stories/writings/ articles) are the (reason/cause/justification) for (attacks) as though the climate alterations will be 'blamed' on someone held up as an enemy. Further, we also see from other aspects that (battles/ attacks/fights) will be (interrupted) by (earthquakes/movements/shakes) and (tidal)[winds]. Further, some elements of the climate change in the region will contribute to the BushCo 'blood drained face' by (compelling/forcing) [nine/9] (millions/many times many) to (flee) for [life] and (safety/refugee). Note that the number 9 is frequently seen and in the past has been successfully interpreted as meaning 'complete' or 'whole' as in 'whole populations' rather than specifically 9 million people. From the lexical structure cross links from Terra to Populace it would appear that some climate changes within the [hills/mountains] of far northern India, likely involving the glacier lake incident noted in earlier part of this ALTA report, will compel large scale relocation of people. This reloca- tion will put pressures, not only on the local governments, but also across the whole region as (wars) are (strangled) by (tides/masses) of [people/populace/tribes/villages/towns/cities] of refugees milling about the battlefields. In the structure itself, at a Terra cross linked sub aspect we note that [battlefields/war plains] will become (covered/inundated/swamped) forcing the [combatants] to (retreat) to the [hills/mountains] where they will be (merged/subsumed) in (rising)[tides/waves/ forces/masses] of refugees. The lexical structure suggests that the people will be fleeing (every- where/all directions/omni vectored) but to the [east]. This (mingle/merge/blend/suspension) of persons is seen as creating (heaving)[chaos] {note the 'state' of chaos, as continuing, and active} which will dominate the (leaders/owners) of the [ground/earth/planet] through to early summer {note end date range is June 26th}.

Water Damage - February 20th

Absent any clues as to geography we note a series of curious date ranges, and climatic indicators. Sort of hung off the Terra entity, attributes to various aspects, we find a series of repeated refer- ences to dates or date ranges. The first we examine is hung off the aspect of [water] which is modified by [rain water] and which has a primary attribute set of (damage/trouble). From this we find several references which emerge from the processing for the date of February 20th. The whole range only goes until the 22nd, and in all the cross links the consistency to 'damage from rainwater' is very striking. There are no meaningful cross links to any geographic specifics. It may be that references to this period and the movements of people from rainwater are all part of the same 'event' and that this February 20th -22nd period is somehow an initiator or proximate cause of the April water impacts.

Wind and Fire Damage - July 20th

Again, absent any meaningful geographic references we note that the Terra entity has a [wind] and [fire] (damage) structure that is completely populated and repeatedly references dates clustered around July 20th. This day represents the point of the [maximum] relative to whatever circum- stances are creating the problem. The interpretation is that between July 20th and August 2nd, we will have faced the [maximum] of this particular period and will be 'climbing out' or 'recovery' thereafter. The whole range of dates seen relative to this period is from June 7th through to August 20th. It is interesting to note that in several entities and cross linked among them, the month of June is seen as marking a period of significant changes. Specifically the earliest date referenced multiple times is June 6th. Thereafter apparently changes will escalate. It is this period which cross links back as the 'center of the bulge' relative to the Populace and the sense of 'numbness'.

Conclusion to ALTA105 Report
This concludes our ALTA 105 report. Our data set includes   many smallish items yet un-examined, but our time period carry values are rapidly   running out. That is, within the emotive summations we are now crossing into   the timespan being covered. This effectively renders any interpretation to be both instantly obsolete, and very difficult. Our last 9 million plus reads were   surprisingly coherent with previous data placements, something that does not   often happen.

The net result that we can take from the report's underlying   data structure is that if the tsunami emotive values have not seriously damaged   our ability to extract emotive shifts, then this year promises to be as most   years, chock full of change. However in the case of this year, it would appear   that we may well see several events which will impact almost the whole planetary   popula-tion. We note so many references to climate catastrophe as to beg one   of two conclusions; either that the tsunami totally skewed all our data, or   that indeed, a major climatic catastrophe is emerg-ing. Now, noting that over   400 thousand people perished last year in a single climate related event, it   is not hard to see that it could happen again.

We also have to note that the total sum references to all   things earth-changes related shot through the roof, that is, scaled to better   than 38% of specific nomative aspects in this run. This is a jump of unprecedented   magnitude. It is not unexpected, but nonetheless, the scale was overwhelming. Past runs have had such references to less than 11%. The recent tripling of   the data points is also after intensive filtering to exclude just such references   to try to 'weigh-out' the emotional impacts of the tsunami.

In spite of our extensive filtering on this run, it is very   clear that there is a view that the tsunami in the Indian Ocean marks the beginning   of significant earth and climate activity, and in spite of procla-mations to   the contrary, the populace of the planet seems to feel that this is not a one-off   event. Further the emotional tone as seen in our modelspace has taken on a completely   new cast in that all entities of all other concerns and focus are now weighted   down under a blanket of concern about Terra.

Processing Note:
Our primary contractors who funded two thirds of the costs   for the run have received a filtered data set of 18 million reads for their   own use as well as two special reports extracted from various processing stages.   They report that they are still slogging through their own processing and do not see themselves completed with their task until perhaps late July or even   August. This means that absent any other interest, the most likely period for   any future ALTA reports this year will be next fall, perhaps September, should   these clients desire more data. As there is no indication of that, this likely   marks the last of the ALTA reports.

The complete collection of the segments for this report   is being made available to subscribers off the ALTA105 main access page. It   will also be made available for non-subscribers off the ebooks page on the halfpasthuman   site.
