ALTA 0308 - Part Zero

Asymmetric Language Trend Analysis Intelligence Report
'Changes in language precede changes in behavior.'
By Tenax SE for HalfPastHuman.com

Note this report is offered for entertainment value only. Any resemblance between the events portrayed in this report and any developing reality is purely co-incidental and in no manner represents foreknowledge on the part of the authors of this report.

Note that this information is derived from humans expressing themselves on the internet. As such, human emotional values and the words used to express them are being sampled and interpreted here, NOT THE FUTURE. Any resemblance between this report and future developments is entirely in the mind of the perceiver and does not exist in reality. The Authors cannot be held liable for accuracy of lack thereof in this report. Authors cannot be held liable for human interpretation of this report nor any action any human takes as a result of this report. Any human foolish enough to alter their behavior based on this entertainment-only analysis demonstrates themselves incapable of rational appreciation of reality, and the authors are explicitly held harmless and blameless for any and all such mental aberrations on the part of the reader.

6.27.2007

Note: Entities are identified by a blue typeface. Aspect words are enclosed in brackets [aspect]. Attribute words/phrases are within parentheses (attributes). Near sentences or concepts composed of both leading aspect and trailing attributes are single quoted '. Interpretive editorial comments are preceded by an asterisk *. Editorial notes are within {} curly braces. Navigation links are in *italicized bold green*, and red when visited.

Our expectations are to achieve 70+ million reads within our bandwidth limitations. We expect a 6 part report series from this data set. Depending on the processing flow there may be a 7th part to the series.

This report in the series created from summation of data from previous ALTA 0108 series reads as well as interpretation of the first 4.21 million reads of the 0308 series.

Get ready, get set, jump....the way things work here at HPH....fishes and farts..

So the data comes in, and we process it down to a thick, syrupy mass all sticky and gooooey, and then fling it at a CAD program where it splatters up in gobs clustered around what we hope are archetypical ideas that we call contexts. We then poke around the interesting, more colorful clumps and try to extract meaning from them in probably much the same way that our ancient ancestors examined chicken guts.

An appealing collection of colors is spotted within our gooey mass stuck all over our CAD program, and then lists are generated in vast quantities which relate all the minutia of the appealing gooey glob back to words within our lexicon and to their assigned emotional values which are summed as the lists are generated.

Then we sit down and read through the lists, as though chicken guts, seeking for meaning from chaos, like most humans.

Some times we get it. A picture emerges in early 2002 within the Terra entity aspect/attribute sets which points toward [fishes swimming over the capitol steps] as an illustration of the coming [flooding] theme. This image we think applies to the near term future of that particular run as the processing does not add any more data to the context as we move through the various data types. So, not seeing data flowing into that context, we figure it is all 'wrapped up' and the idea/meme gets moved over into the pending column. But it does not materialize within the time frames of that run. Disappointment at a particular level, but also a 'wheeew, we dodged that one' sort of feeling as well.....only now we realize that our processing has elements to it that may span multiple years. That our assumptions about emotions and time which we know to be flawed, are waaaay more flawed than has previously appeared.

What has occurred is that the [flooding] meme of the past few ALTA reports is now 'tying up loose ends' so to speak. What had been an isolated image out of a 'we-thought it missed' interpretation, is now moving into, or rather, under, the primary aspect of [flooding] and under our secondary aspect/attribute set of 'global coastal event'. So...hmmm comes into the room as Igor and I watch the data sets move in modelspace and the [fishes over capitol steps, assemblage under water, dysfunction prevalent] shifts and wiggles its way across the screen within the Terra entity to slide under [floods] as a supporting meme. And then it continues to grow, and continues to add detail elements.

Now note that this is not to say that the capitol being cited is any particular capitol such as WA DC. It could be, as WA DC is very close to sea level, but it could just as easily be the capitol of Bangladesh. Or Holland. Or Florida. But the point is that the data set in 2002 was a far leading edge hint of the [flooding] meme being played out some 5/five years later. Given the George Postulate (named after renegade

economist George Ure) that the further ahead the prescient image appears, the bigger the emotional impact when the thing finally manifests, we have to conclude that the 'fishes swimming over the capitol steps' image is probably *not* a good sign, even for lazy fishermen.
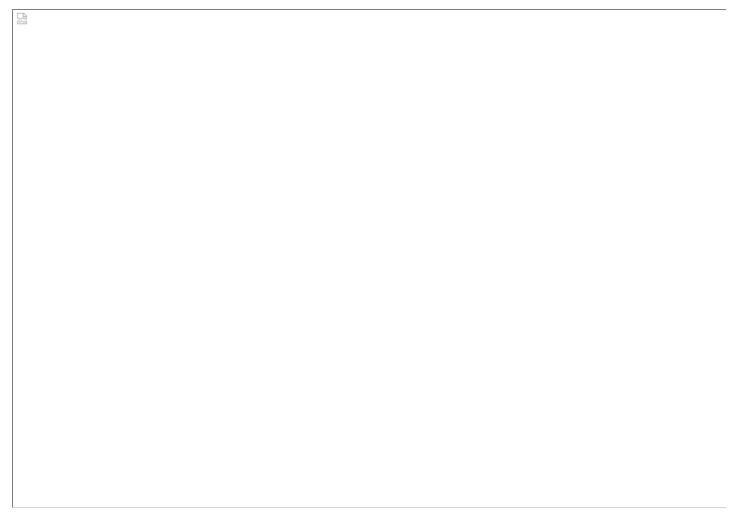

Then we note that the data set continues to build. Imagery of [fishes swimming in hallways], and [limestone crumbling to sand] are part of the sets added to the meme in this round of processing. So the whole of the meme is still growing within modelspace, and that is good. Sort of.

Terra - Apres nous, le deluge

With the recent 'leaks' (pun intended) from reported NASA and NOAA scientists that the estimated sea level rises have been deliberately and grossly *underestimated*, and the global reports of 'strange oceanic behavior', as well as recent magma movements which have yielded quake clusters (as forecast in ALTA 1207, and 0108) in both Hawaii, and California, and with the reported 'disappearance' of a high altitude glacial lake in the Andes, and with the announced 'drowning' of 2/two islands off the coast of Bangladesh, and the loss of several islands in the western Pacific, it becomes increasingly apparent that the 'creep' of [terra intrusion] has begun its 'emergence'.

As we jump into the 'dichotomy' and 'cognitive dissonance' that is life with a tightly controlled press acting as the slave of ThePowersThatBe pushing active denial and constant distraction as the planet begins to drown, it is becoming increasingly clear to the aware individual that things just don't 'add up'. The feelings that this engenders fall under our meta data layer of [duality] which is the expression arising within the modelspace for a condition that can poetically be described as 'seeing both haves of the coin at the same time'. Make sense? We are bombarded and rocketed daily from the global mediastream about the 'global warming' within the context they choose to define, and then there is the reality here on earth where accelerating changes are pressuring *all* of the complex systems which together form 'life support' on Spaceship earth.

ALTA 0108 as well as its predecessor, ALTA 1207, has ended with 'flooding' as a building meme as noted in the chart below. This meme has certainly manifest globally over the course of the first half of 2007, and given the ending data sets from 0108, 'flooding' will continue to make and drive the news throughout the remainder of the year. The 'flooding' meme is multifaceted, and is found in a variety of contexts within a number of entities. This 'spreading' of the meme tends to reinforce the more dramatic forms suggested by the interpretation. Using our experience with occurrence of the Sumatra tsunami, we can now identify characteristics within modelspace in diverse entities as 'reinforcing' meta level contexts for predictions of a more dramatic, or extreme emotional nature. In other words, the Terra entity as well as several other entities were referencing 'electrically driven water' which we interpreted erroneously as a 'storm' when the tsunami was actually being forecast. The subsequent events and our ability to apply them to the modelspace structure as it existed at the time, now show that larger patterns of memes of similar structure within modelspace form when very large, including [planetary/globally affecting], are pending. Make sense? Basically, if we find 'flooding' in Terra, not necessarily a really big deal, but if we also find 'flooding' in all the other major entities, even though each has its own flavor of the meme, then that is a good indicator that a 'really big deal' is pending, at least emotionally. Such is the case now with the 'flooding' meme.

In the predictions forecasting the Katrina/Rita/Fema disaster which we labeled as the 'american diaspora" for all of the 'displaced peoples', there was a notable context which described the presented global mediastream view of the unfolding events. This context was labeled as 'city returning to/overwhelmed by the mud from which the bricks came'. Yes, a bit long, but very descriptive of the unfolding events as far as the structures are concerned. We also had language which referenced survivors 'trying to live on islands of asphalt' and other descriptors of 'isolated tribes/groups camping on man made ledges/outcroppings'. These descriptors have begun to form again within the current ALTA 0308 data sets.

Given the recent emerging Terra issues, it is a very monitored entity, and Igor first spotted the characteristic coloration of the 'city disappearing under the water' structure within modelspace as it was loaded. This area is very large, perhaps several times as large as the form found prior to the Katrina/Rita hurricanes and subsequent flooding. Now a similar structure, albeit far larger and more complicated, has formed which is again headed by 'city under the waves, mud washed into buildings, bricks/cement decay' as was found prior to the flooding of New Orleans. This area of the Terra entity is now supported by emotional sums which bring us back to the lexicon and our rising aspect/attribute set of [great/large losses/destruction]. Hmmm. Probably not a good sign.

As much of the core data capture is in languages other than English, and with a significant per centage of non-Roman alphabet languages, and given the cross links to GlobalPop, as well as to Populace/USofA entity, we are interpreting the very large [flooding] aspect to be planet affecting. The ambiguity of our work is that we cannot tell the difference within the modelspace {ed note: yet anyway} between a single large flood which affects the emotions of the planetary populace and its opposite, which is a flood which is pretty much felt everywhere. In the former case, an example might be something like a flood which takes out the Straits of Hormuz as a shipping lane and thus affects everyone who is an oil consumer on the planet, and gets all the emotions whipped up due to the already heavily emotive subject of 'energy'. In the latter case, a smaller, but more widely spread event like say a global coastal flood of even a few feet, such that cities like New York and Seattle both get ocean water down town while Amsterdam and other low-lying cities have forced evacuations and rescues, would equally meet the emotive summations being seen in the building [flooding] meme.

In either case, the modelspace is clearly stating via the level of emotional summations that 2007 will leave a lasting emotional impression on everyone which will be tied to 'flood' as a context. Damn good timing on that new movie, 'Evan Almighty' about the 'new noah' and his flood issues.

Within our new, 0308 data set the detail descriptors for some of the [visible] components of the coming [flood] disaster are now slightly more complete. They are suggestive of a situation arising wherein the [continuation] of [efforts to rescue/save] [infrastructure] will

[produce] even [deeper disaster]. Apparently the [infrastructure] at risk is doomed, but humans will [continue to attempt/effort (at) rescue] long after they should have recognized [collapse] was [inevitable]. In trying to [save (the) columns/supports] the [crews/groups /tribes] are [place/sited] at [risk]. There is a very large area of support within this lexical structure pointing to [danger] and [dangerous situation] as well as [unstable/shaky] and [endangerment]. Note the last is an 'active' form of the aspect which implies, and in this case is, supported by human behavior. The details in this case are pointing toward a [rescue attempt], though there seemingly will be an [absence] of [victims/people]. Rather the [attempted saving] seems to be pointing toward [insurance/banking] and other [commercial] [records]. These are apparently at risk, and the modelspace suggests that if the [flood/deluge], which apparently will [emerge/manifest] at a [walking pace], gets to the [records/fiche] it will be [30/thirty years] in the [recovery/redoing]. The data set details are sketching out a picture of this 'attempted rescue of records' that is occurring simultaneously with the 'flooding' impacting humans, and rendering [households] [uninhabitable] due to [mud] and [frothing waters], but seemingly, the story of these [drowning records/paper/fiche] will at least rise to visibility as its mini-drama plays out.

In the meantime, as reported in ALTA 0108, there are still details suggesting a [flood] of such a long standing nature that for several days there are [night/nocturnal] pictures of [campfires/cooking fires] on roofs as survivors try to [get by/make do/shelter-in-place]. The data is now suggestive of a total [flood displacement] which may exceed 7/seven millions on a planet wide basis. These are seen as [permanently shifted/moved] persons, and the suggestion from the modelspace is that there won't even be the [pretense] of a [rebuilding] effort. Rather the [cities] will be [officially] [consigned] to the [mud/sea floor] and the [salvagers/scavengers]. Hmmm.

The data sets for the [flooding] aspect within Terra entity are not alone in predicting nasty times ahead. The immediacy values for the 0308 series are continuing to accrue to the [shakes/earthquake] sub set with a large number of geographic references for the [west coast, north america]. This is merely the currently dominant supporting aspect within that set. The totality of geographic references favors the [pacific plate boundary], and then secondarily, the [kashmir triangle, western Himalayas, northern indus river valley]. Within the [pacific plate boundary] sub set, the larger group is currently pointing toward [west coast, north america], but the difference in geographic reference numbers is relatively small. The focus is clearly on the [pacific] region of the planet, and the data set is also still favoring the idea of [tensions, too/extremely built up]. Within the [earthquake] sub set the supporting aspect/attributes are led by [release/shedding /opening/dispersing]. This area is heavily cross linked internally to the [space] sub set of Terra, but also, and rather curiously, to the SpaceGoatFart entity. Now remember that the SpaceGoatFart entity is proxy for all [unknown] and [known, but officially denied] [space focused, based, extracted] data. The area first starts to gain these links as the modelspace is progressed through July and into early August. The data set gains the [space] cross links from a number of sub sets including the termination of many within the [sun] or [energies]. This is probably as close as we will get to a declarative statement that [space energies bring earthquake] within our data set. There is no indication that the [energies from space] emerging in August, according to the modelspace, will instantly cause the [release/shedding] of [infrastructure/buildings/support systems] to which this area terminates in Populace/USofA entity. Rather the data is suggesting that there is a [hesitancy] or [latency] which begins [absorption/integration] in August, and that the [earthquake] follows after some small time delay. This may be a good thing as the data suggests that some [people/populace/citizens] will be [aware] or [sensitive] to the [pending emergence/manifestation]. This awareness is shown with [visibility] cross links to the Press entity so the interpretation is that in the coverage of the [aftermath/results] there will be global mediastream discussion [with] and [about] those [who knew]. As a key element to this [visibility] will be aspects/attributes such as [heard/hearing], [ringing], [tones], [pulses], [irritability/discordance], [dizzyness], and other 'symptoms' of the [sensitives] which will be floating out on the global mediastream following the [tension release].

The supporting sets accreting from the immediacy values for [earthquake] are pulling along lexicon links to longer term value sets. These are running out to our limits of defined time lines in that they refer to [multiple generations] or [80/eighty years] or greater for the 'impact value' of the [earthquake]. The supporting aspect/attributes are filling with detail sets which are cross linked, and seemingly cohesive, and suggest some very large [residual fallings]. This is a new context for the data set. It is cross linked to both the populace entities where it terminates in [living/life arrangements/social order] as well as [housing, physical structures]. The interpretation is that some significant [reshaping] of [social order/living arrangements] will [surface] as a result of the [earthquake (producing)] [residual fallings].

The data details point to [cloth/window-shades] and other [material/fabric] which [falls (from a) great height] and momentarily [resembles/reminds] [sailboats (in the) sky]. This may be suggesting shaking so violent as to dislodge furnishings from tall buildings onto the street below. As there are a number of internally held [visibility] aspects, the suggestion seems to be that this image of [sailboats in the sky] will be captured and floated out on the global mediastream.

This [earthquake] will be labeled based on its [visuals]. The data sets are pointing to [tigers (in the) earth/ground] and [wind ears] as being the [labeling] lexical elements. The [tigers] are supported by [alternate striping] and [dark striping] as well as [dangerous]. This may be pointing to a series of [fissures] or [stripes] appearing in the [tan/orange] [hills] such that [ariel] views make it appear that the [people (below are) walking] on the [emergent tiger's back]. Further the [production] of the [tiger seeing] for the global mediastream will be [hampered] by the appearance of [threatening wind ears]. This is a new context, and its supporting elements are not much more illustrative. The descriptor set for [wind ears] is mainly filled with [wind] supporting references, or [sound/heard] references. There are some small details which seemingly *could/may* be interpreted as suggesting a [wind tsunami] which emerges from the [middle/midway] in the Pacific, and [travels east]. If this is an accurate interpretation of the data set, there is some seeming correspondence at a temporal if not causative level between the [earthquake] and subsequent encounters with [wind ears]. We are fairly sure that this [wind ears] appellation is *not* an accurate characterization, however any other of the supporting aspects also do not clarify, and many are likely very misleading. We are choosing to use the less defined [wind ears] until the circumstances manifest which may allow a better label to be applied.

An interesting cross link within the [wind ears] leads us back to the [gentleman, elder] who is [sheltering] amongst the [trees] first seen in

ALTA 0108. This [older gentleman] characterized as [dark/brooding], but nonetheless [sharing] of his [skills/talents] was the [reluctant leader] who is forecast to bring the [evacuees] out of the [woods] following what is likely a severe hurricane. Now the [western influences] and the cross links from the SpaceGoatFarts entity, sub set [energies] are connecting the [wind ears] which are described as [dangerous] and [threatening] and [inducing of fear] with this previously described [dark night] in the [woods]. There is no direct connection which makes sense within the modelspace, but these may be temporally linked. All of these sub sets have high emotive sums, and contain [visibility] aspects with links to the Press entity. The emergence of the [wind ears] is showing within modelspace as having a Fall or post autumnal equinox primary temporal association. However we note that this was also the case with the first of our long range predictions for the Katrina/Rita disasters, that is to say, more impact in Fall, and even though the event occurred prior to the equinox, the longer term consequences are still emerging. As the lexical structures are similar, though the value levels are now elevated significantly more than the Katrina/Rita disaster, the manifesting circumstances may be also be similar.

The data is also forecasting a [dire] or [dangerous] situation for [patients] in [multiple hospitals], as was observed in Katrina/Rita. This lexical structure contains aspect/attribute sets which describe [patients] in [convoys] of [all manner/irregular/any_or_all] [vehicles] which have a [north eastern] association {ed note: could be the direction chosen for evacuation rather than the place from which evacuated, we can't tell}. Further the [patients] will be [placed/moved] to [risk/danger] by [either choice]. This presumably is suggesting a damned-if-we-stay versus a screwed-if-we-go kind of choice.

Cross linked from the more general [evacuation] sub set are a number of references to a [famous] [boat] which will be [wrecked/driven up] by the [winds]. This is cross linked over to the [patients] areas as well as the Press entity and the [wind ears] sub sets. The [visibility] component is very high so this ought to receive some significant level of coverage within the global mediastream.

Again a note that while much of the descriptors are arriving to the Terra and other entities via the immediacy value set, they are 'hooked' through the lexicon to longer term impacts and emotional summations. This is suggesting a similar but larger kind of impact as has been observed originating from the Katrina/Rita disaster.

If we follow the cross links over to the Bushista entity, as well as to the [officialdom] sub set within the Populace/USofA entity, there are also similar structures developing to what was seen prior to Katrina/Rita. Ironically the most prominent of which is the [officialdom] (thanking) [itself] phenomena which came to epitomize the FEMA component of the times. Also within these aspect/attribute sets are descriptors pointing to [officials] with [damaged] [authority], and [officials whirling (in) confusion], as well as [officialdom without channels (of communications)]. Within this sub set the terminating values are painting a picture of a situation in which [nothing] will [turn out/succeed] as [officialdom] [plans/wishes]. Hmmm. Now that sounds familiar.

As the modelspace is moved through August, and into September, the appearance of the [wind ears] and [earthquake] summations grow. These value sets accrue descriptors for the [destruction] of [ribbons/roads] and [wires] which [bind] [tribes]. Further the aspects/attribute sets are suggesting that from [switzerland, suisse] over to [california], the [monuments] will [change] their positions. Now this is not to suggest that California and Switzerland are going to change places, though we do acknowledge that the Swiss make a good chocolate pie and would be welcome neighbors, but rather a more likely occurrence is the shifting of [survey markers] which are also known as 'monuments' and these may go walk-about in an earthquake, settling in new positions. What is very clear, especially following the cross links from this lower set back up to the [flood] sub set, is that the idea of 'business as usual' will *not* be offered by [officialdom] as a [promised outcome/result] in this case.

Other forms of the [flooding] meme appearing include specific [weather] and [rain] and [north america] sub sets. These are continuing to point to [rivers (in the) atmosphere] which will [flood] and [empty themselves/disgorge] as [rainwater]. These [rainwater] [floods] are still gaining values, and seemingly at an increased rate within the 0308 immediacy values. These values, as well as the steady accretion of [rainwater floods] within the last of the 0108 longer term values, are pointing to a [september] and [post autumnal equinox] continuation of [excessive rainfall]. These lexical structures are supported by aspect/attributes going to details such as [wind driven] and [mudslides] as well as [permanent gouging] and [permanent dislocations]. Seemingly more of the same, yet there is now a new emerging emotional tonality of [dire acceptance]. Or perhaps [acceptance of the grief] which is showing within the Populace/USofA via cross links.

Populace/USofA - In the Family

As the modelspace is advanced along with the accretion of the immediacy values, the last of the shorter term data set from ALTA 0108 is moved into a position of revealing some meaning. The primary aspect of the shorter term value set for the Populace/USofA entity is rising all through the last of the release period {ed note: ides of March through September 19 at about 5:50am UTC}, and this value set resolves to [family] within the lexicon. The aspect of [family] in this case is multidimensional. As an aside, we note that when multiple levels within a single entity or across entities all provide various views of the same meme, then it may be expected that the meme will express itself at the national level as well as being experienced at the personal level by aware individuals. Even the unaware humans will frequently express that they are also experiencing the same meme during the forecast period without being cognizant of the influences. Universe speaks with a multitude of voices and it is merely a matter of training the ears to hear.

In the case of this aspect, the [national] sub set is very clearly hinging on [violence] with supporting aspect/attribute sets of [attack]. The data set is most clear, that is to say that visually the accretion levels rise to notice between September 13th and September 22nd. As the [violence] and supporting [attack] aspects come into focus, the inference from the data is that the [nation] has a [bad attitude] about something?, and that a [bad idea] is being [promulgated/spread/driven]. This brings up the [national] discussion of [attacking]. Much verbiage is shown [spewing] from the never-ending-fount of the global mediastream, with the [corporatists] view point at the fore here in

the USofA. The cross links are suggesting that all will not be well in media-land as many of the [voices] will be seen [shouting out defiance/objection].

It is at this point that the [female personality] discussed in 0108 will have the largest of the initial [visibility] values. She appears coincident with the [attacking] talk. Also at this time, or shortly thereafter [reports/examinations/intelligence] will also become [visible] in which it is shown that the [nation's friends/allies (have) weak lives] and this is seen as a [great/large/huge risk]. Note that [weak lives] can also be interpreted as [vulnerabilities], as well as [insecure foundations]. Given the geographic references, this seemingly is pointing to a [crisis] emerging in Pakistan, and affecting the whole of the Bush wars-of-aggression. There are apparently going to be some very [violent] and [histrionic] filled [shouting] sessions at all levels of the national life over the conditions, *and* the suggestion that the [solution is to attack].

At this time, which is to say mid September through the 19th and beyond into the end of the month, the [conflict] meta data layer is dominant in both the Bushista entity and the Populace/USofA entity. In the case of the Populace/USofA the meta data layer is at its *last* point of high values, which is to say dominance, for at least the next 3/three years and likely beyond. After the September equinox the [conflict] meta data layer within the Populace/USofA begins and sustains a very distinct degradation of values month-by-month. The Press entity is confirming that this shift will be [visible], and the Bushista entity is also confirming that the [alteration/change] of [mind_set/viewpoint] of the populace will be affecting the administration. The cross links from the Populace/USofA over to Bushista are terminating in a lexical set which indicates that the Bushista's will be [taken aback] or [recoil] from the [slap/rebuke] of the populace. Nonetheless, the aspect/attribute sets for Bushista entity indicate that in spite of the [body] of Bushista noticing that [conditions have changed], and in spite of a brief [visible] period of [disconcordance] from the [controllers/princes] of Bushista over this new development, they will still be [propagandizing violence].

At the point of the [dithering Bushie] at its most [visible] within the global mediastream, the [opposition] will shift over to [revolution], at least linguistically. There are significant lexical sets forming which are within the Populace/USofA entity, and which are participating within the [revolution] meta data layer. The cross links are thick and seemingly trigger a reaction from the Bushista entity late in September, about the 22nd. It is also at that time that [revolution] as a meme, and the [military establishment, usofa] both are housed under [conflict] within the Populace/USofA entity. This shift under [revolution] and the participation of the [military establishment, usofa] within the meta data layer of [revolution] has been showing up in the reports for some number of months, and the modelspace is now indicating that in September, [visibility] comes to [revolution] here in the USofA. This is concurrent with, but not caused by the [attacking] language surfacing from the Bush propaganda machine. The real issues are shown as being [core] and [principle] value shifts which are occurring and are temporally linked in their visibility to the [energies from space] meme shown for August. The cross links back to this meme within the SpaceGoatFarts entity originate in the [energies from space] with type [unknown], but terminate in the Populace/USofA entity in the curious structure of [open mouths]. This aspect/attribute set has descriptors going to the idea of [leakers] as in [persons-in-the-know] kind of [leakers], but is also replete with double or triple definitions within each aspect. For instance, the [leakers] aspect/attribute set has supporting aspects describing [energy leakers] both from [open mouths] in space, as well as [receptors] here on earth. Then yet a third complete descriptor set is defining [leakers] as [insubstantial floatings/mirage/illusions] which will apparently [leak] into the [social consciousness] such that they gain [visibility] concurrent with the [emergence] of the [energies from space] shown as starting in around August 13th. The effects of the [energies from space] are showing within the progression of modelspace as gaining strength over the last half of August and then rising into September. The link to [revolution] within the Populace/USofA is not precisely defined, and has too many descriptors of diverse nature to be specific, but the impression from modelspace is fundamentally that 'incoming energies from space *zap* or otherwise move humans to a new *understanding/awareness*' which provides emotional energies that propel the changes shown building in September.

Returning to the [contact] meme expressed in previous ALTA reports, and noting that even the propaganda outlet for the NWO is now climbing onboard as with this story of the reported sighting of a mile long ufo, the Populace/USofA, much more so than the GlobalPop entity, is showing that [contact] and [exploration (of the) Other] are rapidly gaining memes which will continue to emerge over the rest of the release period, and then act as a foundation for changes within the subsequent building period from September 19th through to December 1. This curious bonding of [ufo] and other [denied, or unexplained, or both] phenomena which are housed within the SpaceGoatFart entity are joined by [recognition] and [visibility] aspects from the Press entity, as well as [discernment] as the dominant aspect within the Populace/USofA entity for this lexical set. Clear as mud? Basically it looks like the modelspace is forecasting that a whole lot of wising-up will occur in a relatively short period of time for the populace-trained-in-denial. It will not be emotionally pleasant to watch or live through, at least according to the supporting aspect/attribute sets within the entity.

The accretion of values from the 0308 immediacy sets so far processed are still pointing to a gaining [influence] of [contact] meme within [social order] such that it will soon be having a [visible] impact on [daily life]. This is showing as being [portrayed] on the global mediastream. Some new [developments/emergence conditions] relative to [crop circles] and the [usofa military] will surface as part of the [secrets revealed] meta data layer influence. While interesting, these [secrets revealed] are seen as [merely/only] (interesting) and not shattering revelations, however what is pertinent for the aware observer is that these [crop circles + military] revelations will be a very clear temporal marker to yet more [affects] here on earth of [energies from space]. These [effects] will include some level of [consternation/anxiety] which shows up as reports of [bizarre behavior] within the global mediastream. Hmmm. I sure hope they poi ut out the bizarre behavior explicitly as I am finding it difficult to discern anything but bizarre behavior these days.

Markets - Gold/Silver - '12'

The Markets entity is accruing values for [visibility] within the [gold/silver] sub set as the modelspace is progressed over the course of [summer] from the June solstice until the September equinox. These [visibility] aspect/attribute sets, along with very extensive cross links

to the Press entity indicate that the global mediastream will be [gold plated] with [increasing thickness] over these next 3/three months. However note that the real change for the precious metals, as well as all of the [commodities] classes of contexts, including [food plants], comes just after the Autumnal equinox. These changes in the [respect] values for [commodities] actually begin their building patterns, along with everything else it seems, on or slightly before September 19th. Whatever the totality of emotional tone humming around the human planet on that day, it also will be vibrating the [gold/silver/precious metals] as well as [commodities] in general. Prior to the building emotional tension period of late September through to early December, the [gold/silver] 'buzz', all though growing, will be concentrating on [potential] and [promise] rather than the actual response of the commodities to developments.

These [prospects] will be generally [portrayed] as having a [large success potential]. There are aspect/attribute sets which are suggestive of a [distinguished person] who will be the [new/next/novel] [face] being promoted on the global mediastream and who will shift the [rhetoric] around [precious metals] by several, [deliberate] though [disguised] [statements] which become [promulgated] into [everyone's hearing]. Some of these [statements] will concern the related issues of [supply/access] and [restrictions] to [rare earths] and a [rising] and [desperate need]. This is followed by some [announcement/proclamation] in which [precious metals] are related to [necessary destruction/use/catabolic] and [process] in such a way as to [shift mining future(s)]. Note this last may not be referring to the prices of stocks of mining companies, but rather is seemingly pointed at [alterations/morphing] of the [mining industries]. This last will include some [support companies] which are shown as [offering promise] relative to the [new process]. These events are apparently more temporal markers to future developments than they are particular influences on the state of the gold/silver markets. In other words, the masses of the planet are only barely conscious of these developments within the metals context, but that bare whisper of awareness builds over Summer and by Fall is seen as propelling the building emotional tensions around gold/silver.

With a serious caution to reading this as any endorsement of any price, pricing or 'factoring', we need to note that there is now a very distinct association between [gold/silver] and the number/numeral '12'. This 12/twelve association is curiously connected not to the number's value, but rather to the numeral, as though as a symbol. The idea of the '12' being a symbol is variously reinforced by sub sets within the lexical structure which contain supporting aspect/attributes such as [twelve] which is itself supported by [men digging a grave]. This instance of [twelve] also has aspect/attributes supporting it which includes a [monk/scholar/warrior (is/will) act (as the) opening/reception (for the) '12']. Again noting the appearance of the '12' as symbol and not the word nor number. Very odd.

As the Markets entity, sub set for [gold/silver/pm] is progressed through modelspace and toward September, the aspect/attribute sets are pointing to [positive] influences on [gold et al] which arise from [negative manifestations/emergences] in other areas of life here on earth. The Markets entity data sets include references to [failed/crashing] of [partnerships] of all kinds from [political] down to [commercial]. The data is suggesting that the bubble in M&A activity will be very severely threatened by the coming [revelations] regarding the [partners (who are in) trouble] and a separate meme will come up about [partners, commercial] who [cannot provide what is asked/negotiated]. Further this aspect/attribute is repeated in many of the [political] associated lexical sets within the GlobalPop entity, and the Populace/USofA entity, and each of these have extensive cross links over to the Markets entity suggesting that [failed political partnerships] will produce very large impacts on markets over the course of Summer.

As this sub set is progressed through modelspace over the middle of Summer, the data sets are showing that [officialdom] will mount a [campaign] of [opposition] to what is happening in Markets entity, specifically related to the [gold et al] sub set. This [opposition] will be quite [brutal] and is showing as being [short-lived], but also [violent] and [repressive]. There are indications that very large [losses/failures] will be [calculated] by [officialdom] with [no thought/care] for [repercussions] beyond [strict adherence] to the [hidden goal]. The problem for [officialdom] is that this [repression] phase breaks up due to, at least in part, the influence of [secrets revealed] within Markets. This sub set is pointing to an early-to-mid August [episode] of [spillage/leakage] of [material] which also causes [secrets] to [ooze] out into the global mediastream. It is at that point in mid Summer, that the [opposition] begins to [fade/fail]. Much of the [failure] will be temporally marked by [uneasy/disconcerting] [gossip] which hits the global mediastream, and is a precursor to the [trouble of friends]. There is then a discussion within the global mediastream about [getting involved (in the) political stew], but a co-incident [lawsuit] related to the situation will act as a [derailing obstacle].

Further [aggravation] for the [officialdom] and their [suppression effort] comes in the form of [political and military] problems with the Bush wars. The data sets are identifying the [bush wars] via cross links as the precipitating factors to the late August and September [alterations] which occur within the [markets structure]. The [mud/dirt/scandal] which is [revealed] in July/August relative to the [retreat pending] causes the [markets] to hit something of a gut-check time globally. The [usofa dollar] as well as global interest rates will be very much affected, and the [currency disease(s)] will also rise to [beset/bedevil] [officialdom]. And this is before the 'main act' even starts in late September. The data set is also indicating that the [markets] will [react] to [news/rumor] coming from the [war front] about [enemy ambushes/assaults]. This reaction is shown as [negative] and is heavily cross linked to Bushista and ThePowersThatBe entity where in both cases it terminates in bespoke [fear] aspects. In both cases the supporting sets are filled with [shock] and [rage], though noteworthy is the lack of [grief] associated with any of the [carnage] which sets off the whole [episode]. This [episode] is temporally important as a marker, as well as being [symbolically] important in that [global community] is shown as [becoming aware] of the [limits of power]. In other words the data sets seem to be saying that a shock to the system will come when so many realize just how really power-less are the TPTB, and Bush et al.

There are an increasing number of cross links originating in Terra entity which are terminating in 'affected/affective' areas of the Markets entity. Given the continuing accretion of values for a 'mind set' change within the populace relative to terra, and the biospheric alterations now occurring, it seems probable that part of the very large mind set change will influence the markets in a noticeable way beyond the [green meme] now emerging. The data set is taking a much more grim view of the developing situation and is suggesting that a certain [ultimate risk] kind of 'doomerism' will manifest as part of the shift. The [visibility] aspects and cross links to Press entity suggest that

there should be global mediastream language around this concept in late September and beyond.

The data set is also pointing to a [former girl friend] who is going to be [visible] within the global mediastream and who will be [secrets revealed] incarnate. This [telling tales] will continue for a while within the media, and will have a very energy sapping effect on the markets, and specifically on a number of [resorts]. This lexical set somehow relates to [disease] and [illness] and [poverty] such that the whole of the [resorts] area is to be impacted, again showing for mid Summer initiation of the event-stream and continuation into Fall. There are broader implications which will be [focused] by the [former girl friend] and her appearances within the media, but the first clue for the aware individual will be the [trepidation] which will be [visible] on the [upper lip]. This is presumably the 'spokesliar' for the resort industry...but the immediacy values are less than clear on that point. What they do show is a very large, and finally acknowledged by corporate media [emptiness] which is affecting [resorts] due to [disease]. The [poverty] aspect is supported well, but with a diverse set of aspect/attributes. Some of the aspects are pointing to the role of [poverty] in the [disease] which causes so much concern, and then others are pointing toward an [increasing awareness (of) personal poverty] which besets the [frequenters/users] of [resorts] such that their [poverty impressions] further aggravate the situation.

As the modelspace is progressed past the [officialdom opposition] campaign, the [gold et al] sub sets begin to acquire building tensions just slightly before the rest of the entities, say around September 8th or so. This building tension tendency continues through Fall. The lexical sets are showing that [divine inspiration] will be [touted/proclaimed] by some within the global mediastream when they are [recounting events] which [increased their presence/wealth]. The indications are that gold et al will be rising both as a meme of [personal armor/protection], but also a [unifying force/center]. This last comes from the [currency, global trading] sub set and is very well supported by a very diverse number of early emerging lexical sets.

The [gold/silver/precious metals] data sets show very large grow in [october] relative to other building emotional trend contributing aspect/attribute sets within the Markets entity. This is to say that the [gold et al] sub set has a rising, and disproportionate influence on markets in general beginning and after October of 2007.

Returning from the far distant future of October to the more near term time, we note that the current hedge fund crisis is the leading edge of the 'near death experience for the usofa dollar' which was discussed in ALTA 0108. The NDE will continue to play out over the course of this summer, and as forecast, began its [creeping visibility] within the lunar month prior to the June 21 solstice. During the 3/three days of the solstice, the data had predicted that the [NDE for the usofa dollar] would [shift] into an [active] state of [crumbling documentary support]. And, so it would appear, it has. The recent market volatility does not seem to be pointing toward a 'usual' summer of low activity, but rather something different is emerging. For the behemoths of the global corportacracy, different is not good.

We have labeled this summer as a [bad summer] for markets, derived from the data set, and have chosen the appellation of 'near death experience' for the experience of the usofa dollar over these next few months. That was a deliberate choice at the time of the previous ALTA report as we had no data suggesting the resolution of the pressures on the dollar, and we *assumed* that it would recover, or be saved for yet another few months until the next crisis. But, we could be wrong in that assumption.

The data sets are pointing toward a huge [liquidity crisis]. The archetypical aspect/attribute imagery goes specifically toward [punch bowl empty], [liquor bottles overturned], [wine cask spilled on table, empty], and other such poetic references to [sobering up] from the [heady rush] of the [bubble(s) era].

We have sets of bespoke emotional, and conceptual [fabric torn asunder] expressed as [expectations, not met, unrealizable]. We note that the [expectations not to be met] are centered on [dollar behavior], and have cross links internally to all other aspects of the Markets entity as well as numerous cross links over to Press entity, and Bushista, and ThePowersThatBe, as well as both populace entities. This area is still contributing at least one-third of the summation values for the September emotional tension turn-around into building tensions.

The archetypical imagery for this area is filled with repeated statements that [many/millions (of) small particles compose (a) mountain (of) worries/troubles]. The lexical area is specifically contained under [housing], but also has [energy] and [food supply] participating via cross links. The clear indication is that the [liquidity crisis] will be [forced] by the [acknowledgment (of) tens of millions (of) individual distressed conditions]. The [distress] will rise over the course of [summer] as the [encounters with scarcity] meta data layer goes vertical in both populace entities, as well as emerging in Terra entity as a dominant meta data layer. The data suggests that [disquiet] will be expressed by the populace such that the [useless/bound politicians] will [sweat cold (in spite of the) heat]. The bespoke [fear] emotion is highlighted in all of the [officialdom] sub sets in all the major entities. It is going to be a very [bad summer] to be a politician.

Part of the political woes will emerge from the [employment crash] just now starting to manifest, and the many tens of millions who will [lose every thing easy, (now that) times (are) realistic/hard]. The data suggests that [foreclosures] will be seriously exacerbated by a sudden [attempted] [draw down/withdrawal] of [401K's/retirement accounts]. The scenario seemingly suggested is that in reaction to the inability to [borrow easily] due to the slow play out of the 'debtberg' flipping over, the [tens of millions] of [distressed household debt holders] will seek to [withdraw against the future] by [sacking/pillaging] their [retirement accounts]. This trend will be under the influence of the [duality] meta data layer in that it will impact the markets as every one tries to get liquid, just as the big retirement account mangers aka [hedge funds] are also having a liquidity crisis based on those same individuals *not* being able to [borrow easily]. This [duality] will reinforce itself as more try to [loot] their [future], and more press reports on it, more will try it, and so it goes. Then of course that [withdrawal wave] will also put [liquidity] pressure on the funds, which in turn....and so it goes on. Then the press on the hedge fund difficulties grows, and the dollar [decreases] which places more financial pressure on the tens of millions of the distressed who then try and scrounge more money out of the system which places more pressure on the liquidity crisis at all levels, and so it goes on and on...

It is tempting to think that had the NDE for the USofA dollar come at a different time, under different administration, that something (perhaps) could be done to ease the transition to the next-financial-world. But, luck of the draw, we live in interesting times, and to quote an old refrain "it don't come easy".

Bushista - Semi-demi-pre-quaver, Ten Months Burn

As the Bushista entity is progressed, along with modelspace, through the last of the 0108 data sets, and including the first of the 0308 immediacy values, a blip appears associated with the Vice Dick, Cheney. In the early movement of the modelspace, it shows the current [conflict] around his claim of 'extra-ordinary' powers to continue to intensify through to just past mid July. During this time the [hidden warfare] within ThePowersThatBe entity starts to emerge with the Dick Cheney [problem] as its surface focal point. Then as the entity passed through July and into August, a series of other events take the impetus away from battles with Dick-tatorial powers, and Cheney takes a vacation.

Events here on earth and near by in [space] bring Dick back from vacation, refreshed, bloated, and belligerent just in time for a [september demi-quaver] in which influences of [health] and [personal powers] will be [shaken] just enough to create a continuing, low burner meme which the modelspace shows runs out to March of 2008 when the [quaver] bursts out as a very ripe tone. This emotional [tone] has very long term values associated with it such that the data seems to be pointing to it totally dominating the rest of Dick Cheney, position, and life.

The Bushista entity (more in part One) is showing an accumulation of longer term values pointing toward a [10/ten months (of) burning]. The [burning] can also be translated as [hellacious] and therefore the whole interpretation perhaps should read [10/ten months in hell] especially as there are to be many sources for the [burning]. The implications from the data set are that the Bush administration has but merely begun its [polishing of failure] to an art form. The aspect/attributes sets within Bushista are suggesting that [old sins] are going to [combine/conjunct] [new mistakes/bad_reactions] to produce an absolute [stew of failure (and) misery].

Conclusion: Part Zero - Nasty Weather...enjoy it while you can

As Igor notes when examining the raw data streams and the visual processing clues the programs place on the screen, 'going to boring'...and mostly he is correct. After a while there is only so much that can be said about [floods]. And we thought that we had said almost all of that in previous ALTA reports. However we do note that the [banding] or [striping] of the planet previously forecast waaay back in 307 (if memory serves) is manifesting now as the weather patterns (driven by stationary low pressure areas) appear to have become stuck producing stripes of alternating drought and excessive rainfall/floods across all the continents with the 'stripes' running from pole to pole. In those earlier ALTA reports the 'bad news' was that the 'striping' would end....hmmm. What was being forecast was that no matter how nasty the weather during the 'striping' period may be, it would only get worse globally when the 'breaks came'. So, my apologies for the repetition ad nauseam on the [flooding] meme, but as I responded to Igor, 'well, flooding is bad, and perhaps boring, but you'll miss it when it stops'.

It is the current understanding here at HPH that the striping/stationary banding of the weather marks the last of the 'near normal' weather years. That after this time, 'emergence' is no longer the operative meme, and we will have slipped into full-on, 'manifestation'. In the 'manifestation' time, according to a record of longer term values kept over the course of many ALTA reports, many new forms of 'social order' will be tried. It is during this time that 'reactions' to the developing 'employment crash' as well as 'adaptations' to the 'biospheric changes' will be rising to visibility *even* to the unaware. This is a particularly key point as the times, tides, and circumstances will have moved, but according to our predictions, many hundreds of millions of humans will still have their minds stuck in the 'old view' of reality. Some of those hardest hit by this slap-upside-the-head from universe will be those who *thought* that their planning has prepared them for the manifestations.This will cause many problems as a general freak-out occurs as these people are forced by universe to confront the *real* new world order.

###

We are posting Part Zero a few days early. It is anticipated that Part One will be posted by Sunday, July 8th. The slight delay over a week is due to a commitment to an interview on Coast-2-Coast which is a very late night show and keeps me up waaaay past my bedtime. In fact it keeps me up into the next day. George Ure and I will be the guests on the show on July 4th and into the 5th. There will likely be many minutes of nothing but fireworks noises given the day and our neighbors penchant for all things explosive. However the exercise is necessary part of entrainment in the social order even though it will mean several days of disturbed mental state much as jet lag. This is why the extra days necessary on processing and interpretation for Part One. Down days due to time shifting into the world of late night radio talk shows. A very scary prospect for us morning people.
