Asymmetric Language Trend Analysis Intelligence Report
'Changes in language precede changes in behavior.'
By Tenax SE for HalfPastHuman.com

Note this report is offered for entertainment value only. Any resemblance between the events portrayed in this report and any developing reality is purely co-incidental and in no manner represents foreknowledge on the part of the authors of this report.

Note that this information is derived from humans expressing themselves on the internet. As such, human emotional values and the words used to express them are being sampled and interpreted here, NOT THE FUTURE. Any resemblance between this report and future developments is entirely in the mind of the perceiver and does not exist in reality. The Authors cannot be held liable for accuracy of lack thereof in this report. Authors cannot be held liable for human interpretation of this report nor any action any human takes as a result of this report. Any human foolish enough to alter their behavior based on this entertainment-only analysis demonstrates themselves incapable of rational appreciation of reality, and the authors are explicitly held harmless and blameless for any and all such mental aberrations on the part of the reader.

08.12.2006

Note: Entities are identified by a blue typeface. Aspect words are enclosed in square brackets []. Attribute words/phrases are within parentheses (). Near sentences or concepts composed of both leading aspect and trailing attributes are single quoted '. Interpretive editorial comments are preceded by an asterisk *. Editorial notes are within {} curly braces.

Data set distilled from 19.623 million reads. Our expectations are to achieve 70+ million reads within our bandwidth limitations. We expect a 6 part report series from this data set. Depending on the processing flow there may be a 7th part to the series.

Markets - Duality Presses Hard, Meadow Men Exacerbate Rot

All of the linguistics accruing during this first processing of the shorter term value sets are, within the Markets entity, focusing on 'events/conditions {of an} external nature'. The data set is replete with support for the idea that 'external events/circumstances drive' and that 'internal circumstances fail {to be} important'. Further the 'external circumstances' include 'receipt/receiving metal arrows', as well as 'difficulties {arise/come from} drought, and {impact on} flesh/flesh_foods'. This latter is also participatory within the rapidly developing 'encounters with scarcity' meta data layer, as well as supporting the 'duality' meta data layer.

In watching the expression/manifestation of the 'duality' aspect over these last few months, it occurs that what is being foreshadowed is the appearance of '2/two americas' within the Populace/USofA. This will obviously be a case of 'haves' and the 'have nots'. As we have maintained for these last 2/two years of processing, a '70/30 split' is coming in which the '70' who are the 'have nots' will be in 'conflict' with the '30'. This 'conflict' is defined by descriptor sets of a very violent and bloody nature. The expression of this particular conflict is not, as suggested by our modelspace, going to be 'gentle'. Rather it is described as 'cathartic' and 'blood cleansing' while also being replete with imagery of 'blood flowing {within/on} asphalt' and 'blood runs {to the} barricades'. These impacts of 'duality' on the Populace/USofA are cross linked extensively to the Markets entity and specifically to this area of descriptors going to the idea that 'duality in all things/markets intrudes'. This would seem to indicate a point after September 15th, from which a fundamental change will be able to be delineated, and further that the 'change of state' will have huge impacts on the nature and behavior of the Populace/USofA.

The Markets entity component to the rising 'emotional tension summations' shown within the chart below,

Chart 1

is at least partially caused by the late August impacts from the 'violence' episode forecast by the Terra entity. The manifestation of the 'violence', and 'sudden shocks' within the Terra entity are shown as support for the rise of the emotional tension levels beginning after September 5, 2006, however we note that much of the rise between September 14th and the first of October beyond the Terra related "floor" of the emotional tension is directly attributable to the Markets entity. This entity is showing that 'echoes' and 'bad headaches' from the 'violence {of the} earth/ground/terra' will dominate the latter half of September and set the tone for the long emotional uphill march through to the Winter of our 'discontent/confusion/anxiety'.

Well, it is not particularly"newsy" information, but our modelspace for the Markets entity shows that the Chief Dick, President of Vice, D. Cheney, will have his own Fall 'encounter with scarcity', only it will not be 'material', but rather a 'scarcity of fellowship/companionship'. This is due to the 'humiliation' and 'outcome of regrettable behavior' shown by the linguistic sets as the joining of 2/two aspects in primacy. These are 'clans/tribes/associations', and 'distinctions/discriminations/separations'. These 2/two descriptor sets have fully populated support areas within the Markets entity which go to the idea that the Chief Dick will 'ruin', or 'spoil' the 'markets/trading' with 'support {for the} inferior' and 'outspoken rhetoric'. Further there is the suggestion within the data that the 'contact/association/fellowship' with 'men {of} inferior reputation' will 'fuel fires/burning/destruction'. There are very extensive cross links between this area of the Markets entity and the Populace/USofA, sub set 'politics', as well as the 'crime/criminal' sub set. The implications from the accrual of new shorter term values within the processing are that the 'chief dick' will be caught with his 'men {in the} meadow' and that the 'meadow men' will be central to the 'rot {under} smells/smelly/stinking {ed note: active case of the descriptor, i.e. verb, not noun, implying an active playing out of the situation with many changes/developments} manure'. In a very curious, and poetic reinforcement of the idea, aspects under the 'manure' descriptor go to the imagery of 'poetic words, sweet/strong {are} spoken {with/while} feet, ankle-deep {in} shit/manure'. Further the cross links show that the 'smell of the ankle-deep shit' will indeed 'reach the noses' of the Populace/USofA. And, again, the whole of this area is Markets related, and is pointing to a 'political exacerbation' of the developing degradation of Fall. There are further links to previous longer term data sets starting positions prior to the progression of the modelspace which indicate that the 'actions/reactions' of the Markets this Fall to the Chief Dick and is 'meadow buddies' will have very serious echoes in Spring {ed note: Ides of March}, and will be participating in the 'secrets revealed' meta data layer going vertical in Markets, and the 'secrets revealed' large step up within Bushista. This latter appears to be an 'echo' of the Pentagon Papers incident of the last century. We have some distinct linguistic sets going to the idea that 'liberation/freeing {of} documentation/evidence {will} blanket/cover/inundate {the} populace'. And further that this 'evidence' will 'bind skin {to} forced/coerced slavery/debt' which in turn is seen as being the 'leading edge/wave' of the 'repudiation {of} continuing crimes'. Hmmm. Probably just a peek of 'business as usual', but

the sheeple are so blinded by their high fat diet and "reality" teevee that it will come as a huge shock.....whatever is revealed.

Terra - Muddy Road Fishing, Water on the Earth

Given the recent "flare up" of earthquakes in Central America, it will likely come as no surprise when the data set shows that a 'flattening' or 'reduction to flat/thin' is anticipated for a large Central American city sometime after the Fall equinox. The data set seems to be suggesting that the earthquake coming in fall will be an 'echo' of a previous earthquake, at least in so far as its impact. The data set is showing a higher level of geographic references to the core of central America, south of Mexico and north of Panama. This suggests the quake to be centered within this area, though there are suggestions that a tsunami will 'run the seas' and at least some impact will be felt as far away as Japan/Philippines.

The data set is showing some number of references to Managua, Nicaragua though these are seeming suggesting that this area will be a 'stage', likely for the 'assembly of relief'. We do note that the whole of the area within the Terra entity is clearly going to the idea that a 'city of bricks' will be 'flattened'. The 'city of bricks' is associated with a 'lake {in the} bowl {of the} mountains'. The descriptors are going to the image of the 'solidity {of the} mountain releases/gives_way' and that the resulting 'shaking slops {contents/water} from bowl'. The 'splashing/sloshing {of the} lake' is shown as creating its own set of problems by 'coating/covering/blanketing' the 'only paths/roads' out of the area in 'mud' which is understandably, 'filled with fishes'. There will apparently be so many 'fish' deposited on the 'roadway' that the inhabitants of the area, in their now homeless and 'dire conditions' will be able to 'eat/subsist' on 'muddy road fish' for several days. The descriptor set is showing through the aspect/attribute details that 'campfires/cooking_fires' will be seen in 'legions' and will create a 'constant/steady white haze' over the area. It will be the 'smoke, choking, blinding' which will apparently cause the problems for the 'rescue effort/attempt'. As the area is 'situated on the shoulder of the mountain' efforts at air lifts and such are problematic under the best of conditions.

As the aftermath of the earthquake is being felt within the hemisphere, the data set suggests that other 'troubles' will prevent the 'initiation' of any 'real relief'. So what develops is forecast as a 'transformational event/manifestation' for the region.

First we must note that 'transformation' is developing into a meta data layer. It is now appearing in over half the entities within modelspace, and as with 'conflict' is showing as a rising aspect within each entity. This means that the data processing procedure of each week's data load is placing more of each entity's descriptor set *under* the 'transformation' aspect. As the aspect rises within each entity, and gains more complete population of its supporting aspect/attribute sets, and as it appears within more entities, it rises to meta data level status within the modelspace as a whole. This is seemingly occurring with the 'transformation' aspect now.

Within the Terra entity, 'transformation' is now dominant over significant sections of the entity. This presents the interpretation of all of the details with an extra component which must be factored into the result. So in this instance we have references to an 'earthquake' with large numbers of 'central american' geographic references which appears within the 'earthquake' aspect/attribute set as support. Further the 'earthquake' aspect is held by the 'transformation' aspect as a supporting component of its aspect/attribute set. Thus the interpretation should include the concept that a 'transformation' of significant size, affecting large numbers of people will result. Make sense as to how that works? Our earthquake information which includes the descriptor set for 'brown and dark red' bricks, as well as the 'bowl in the mountains' is all held within the 'transformation' aspect, and if we apply the aspects on a top-down basis, then the read comes out similar to 'a transformational event will impact a dark-red/brown brick city nestled on the shoulders of a mountain next to a lake held in the bowl of the mountain range in which it sets and which has a very large population who will be reduced to homelessness but will fortunately be able to eat the fish who used to be in the lake prior to the transformational event which is probably an earthquake'. Yah? Clear as the 'mud to cover the roads as a result of the lake being slopped out of its mountain bowl during the transformational earthquake'?

Other supporting aspects of the 'transformation' aspect are suggesting that the 'earthquake' will actually result in the 'transformation of the land/ground/planet' as though the impact will be large enough to 'require new maps'. Further the 'transformation' of the 'lands {will} also transform' the 'nature of the people/tribe' . This last transformation is being shown as a 'fading/withdrawing' from the area and a 'long walk uphill' to the 'forests/farms/rural life'.

Close to this area, and *perhaps* related, is another section also held within the 'transformation' aspect which is headed by 'water on the earth'. We need to note that the reference is similar in total descriptor set to the early 'electric water rising' which was our 'tsunami' aspect prior to modeling the word 'tsunami'. Now that we have 'tsunami' as a descriptor set, and given the discussions containing the word on the net, it is no wonder that it is detectable within the data set. As a check against "conscious word pollution" of the data, we have other descriptors which provide a second opinion on the subject. One of those has risen to near the top of the Terra entity over these last weeks of processing. The suggestion is for a 'tsunami' which will 'place water on earth'. This reference is supported by a number of geographic indictors pointing to the eastern Asian coast, including Japan/Philippines. Further this area is extensively cross linked internally to the previous 'earthquake' descriptors as it noted above. There is some area of ambiguity though in that a number of its cross links also go to other 'earthquake' descriptors within the Terra entity. However, temporally the 'tsunami' reference is singularly linked to the 'transformation' aspect, and thus to the 'central america' sub set with its 'earthquake' aspect.

While shown as being 'transformational' in nature, the 'tsunami' references do *not* have extensive support indicating wide spread damage or death. This may be due to its pending nature, and perhaps what is being picked up are the very early indicators with only few emotional descriptors. The 'tsunami' is indicated to 'put water over the earth' and to do so 'in great measure', *but* we have few details to

suggest that the occurrence is as significant as the 2005 Sumatra tsunami. One note of caution on this is that modelspace could be showing that so many other 'transformational events' are on-going, that within the grand scheme of things, this tsunami is really minor, no matter how much damage it brings.

There are some large number of aspect/attribute sets within the Terra entity which would tend to support the view that, given all the other crapola happening as circumstances manifest all over hell-and-here, that a 'tsunami' *is* merely yet-one-among-many concerns for a planetary population being rapidly {ed note: also, mostly against its desires} transformed. The rest of the references within the Terra entity to the sub set of 'oceans' are also not of the sort to be conducive to a relaxed attitude about things here on earth.

The 'oceans' data set is replete with words carrying warnings in the form of bespoke references to 'danger' and 'risk' and 'alteration/transformation {of the} oceanic environment'. Further there are extensive supporting structures going to 'dense clouds, no rain'. This area is notably linked internally to the still pending 'pan hemispheric storms' data set. There are aspect/attribute sets in supporting roles with images of 'cave dwelling' and 'hiding {from the} oceanic transformation'. Further branches of the supporting structures show that 'officialdom' is the likeliest candidate to be 'hiding' and that 'audiences sought' with officialdom/leaders 'are denied/discouraged'. This fits with cross links showing that 'repression' from ThePowersThatBe will 'sit on officialdom' as a 'water buffalo' covering the 'mouth'.

The data set paints a rather dismal picture of the 'oceans' returning to an 'abysmal state'. An alternative interpretation also goes to the already reported 'destruction of fisheries' discussed in ALTA 1206 and earlier series. In this case the alternate interpretation can be for the 'oceans' to become as 'deserted as the abyss' and to only 'hold {the} drained/depleted carcasses of the small creatures'.

GlobalPop - Paralyzing, Iraq Bye Bye, Knots of Influence

As we go through the processing, it appears that some new strategies and tactics are to be 'employed {for} actions'. This linguistic structure is seemingly showing that a new approach to 'war' will include the use of 'paralytics' and other 'mind altering/warping' drugs. At this point this is merely the first appearance of this linguistic set. It is complete, and correct, within the meaning of those terms within our radical linguistics approach to computing, but is not fully populated. This suggests that while it is arriving within the shorter term value set, the effects or 'expression' of this meme is still some ways off. Stated another way, since there is little in the way of detailed support for this structure to be found within the shorter term value set, we are *assuming* that the longer term values will supply some of the required support when those are processed. This also means that what we are getting here is a small amount of the "temporal leakage" which happens due to the rather arbitrary nature of our assignment of words/descriptor sets into the time associated categories. Stated yet another way for clarity, this may be a case of we 'got the word in the wrong category; immediacy, shorter term, or longer term'. Without regard to its temporal state association, we nonetheless are able to see that the 'asymmetric warfare' will begin to explore 'paralytics' as the 'hidden weapon' of choice.

Iraq, as a sub set of the GlobalPop entity is participating in a number of the meta data layers. Most of these layers go to the idea that the Bush War of Aggression will be 'collapsing' of its 'own weight/mass' by early Fall, and that the populace of Iraq will be 'seizing initiative' while 'moving {onto/in} unexpected ways/paths'. Further the data suggests that along the way the 'army' of the USofA will still be involved in a 'fighting retreat'. However, some aspect/attribute sets of the lexical structure providing the main bulk of the 'iraq' sub set within the GlobalPop entity are going to the idea that 'unexpected past frees {current/now} actions', and that 'revelations shock/rock power tower' which in turn leads to 'release of reins'. It would appear from the data set that 'old wounds/past hurts' will be coming out in the general step up of the 'secrets revealed' meta data layer within GlobalPop which in turn will 'force open {the} mouth' of the Bushista entity and out will pour 'foul/depraved revelations'. These in turn will 'wipe clean' or 'destroy' any last remaining "honest" support within the Populace/USofA for the Bushista regime and its international actions/wars. This 'revelation of mud/shit/mire' is shown as being a 'telling' of the 'instance of old blood spoilt' that 'brings tears' to 'men in public'. Somehow this 'revelation' will 'recoil/rebound' and cause 'stomach harm/hurt/wounding' which, within the GlobalPop, will lead to the 'removal of restraints' upon Iraq. Of course, it is just as possible to take the secondary aspects from the descriptor set and proffer the alternative interpretation that 'iraq {will go} bye bye/dissolve'. For a great many reasons this appears to be a very much more solid, if alternative, interpretation. If this is to be the case, then the first on-the-ground indicators are shown as appearing around September 2 through 9. Then the later 'echo' of this initial 'dissolution' will manifest as a 'concrete/rock' de facto occurrence in Fall.

Also within GlobalPop entity is a "knot", for lack of a better descriptor, of cross links originating around a large lexical structure of internally held values which are going to the idea that 'earth changes' as well as 'political changes' will participate to cause a very large boost in the impact of both 'restricted movement', and 'encounters with scarcity'. This lexical area is newly accrued values of the shorter term set, though they are at the far edge of the set, and are focused on the late November through December 22 {ed note: the Winter solstice}. The implications that arise from just the movement of the entity as modelspace is progressed are that large segments of the population of the planet will be 'under the influence' of the 2/two meta data layers.

The more dominant of the meta data layers is 'restricted movement', however, this layer is shown as being casual in many instances of 'encounter with scarcity'. The GlobalPop entity is showing within the supporting aspect/attribute sets that it is a combination of factors, both environmental, and political which will make this particular Fall sharply different from others. There are lexical sets going via cross link to Terra, both originating and terminating which suggests that the Terra entity will play a very large part in 'afflicting' humans with 'restrictions on movement'. Within the Terra originating cross link sets there are descriptors for 'fires' as well as 'flooding' and 'mud slides/earth movements' as causative factors for some of the movement problems. Also we note that the Terra entity is showing

'antarctica, south pole' related 'coastal impacts' which in turn are shown to 'require rebuilding {of} ports'.

Much of the 'restrictions on movement' are shown as 'water' related; perhaps as much as 80/eighty per cent. There are also, even within the 'water/flood' lexical descriptor sets, supporting sets which are headed by 'fire' as an aspect. Many of these are showing up as 'fires below water {line/level}' and that these 'fires burn {in spite of being} surrounded {by} flood waters'. The imagery is very clearly pointing to flooding followed by fires within structures which are 'isolated' from 'assistance/help/remediation' due to 'miles of water' and 'hundred(s) of flooded roads'.

The lexical sets within the GlobalPop entity are also supported in wide and general fashion by aspect/attributes at lower levels going toward 'ignorance' and 'regret'. We also find that some detail sets show that 'brazen behavior/risks' will be 'unwise' as the 'second wave' {of flooding?} is showing as 'unseen', and 'hidden'. This in turn is supported by aspects/attributes for 'regrets', and 'brakes/stops/halted', as well as 'piles {of} people cork/bouchon/block {the} valleys'. Deeper within this set are descriptors which paint a fairly bleak picture. The image is one of people being 'driven {by their} bellies/hunger {toward} unwise/risks without control {over their} actions/self'. Further that 'hunger {is too} strong, unwise trapped, restricted movement, starvation, conflict'. There are also deeper supporting sets going to the idea that 'those/unlucky trapped/confounded {by } floods/water_risks {will/can} live {at the top}' at least until the 'fires' begin. There is further supporting language going to the idea that 'some will climb away/up from fire, flood' and 'flee {by} rooftop'.

At the top level of the GlobalPop entity where 'restrictions on movement' is most dominant is a small supporting sub set which seemingly describes a 'party/gathering/celebration' which will be 'interrupted' most rudely in the 'tallest of places'. This 'tall party/celebration' will through happenstance, as indicated by cross links over to the ThePowersThatBe entity, involve some 'politicians' and their entourage such that 'military' is sent to the rescue. However, the data set would indicate something far less than successful. The suggestion is that the 'rescue' will 'fail with death/dying' and that 'those remaining {pols/officialdom}' will be 'trapped, soiled, wet, cold, at risk' and some will not make it out. The rescue descriptors bring up the image of 'people pushing past infirm to claim space in a helicopter only to end up crashing with it into the flooded, flame covered streets'. Hmmm. Sounds just like politicians, both unprincipled, and unlucky.

Conclusion: Part 2 - Dread Times Gnaw Gritty, Rising Tides, Deep Thought, Restrictive Morgellons

As may be understood from these reports, our data set is all about exploring the nature of the 'times'. Disregarding 'time' and its fantastic nature for now, and concentrating on the 'times' or the 'current period of manifestations/circumstances', we can note that while 'time' is vague and without form, the 'times' are a stew of emotions attached to circumstance/manifestations such that broad blocks of 'the times' will have a flavor in the mind of time-aware/time-gnawing humans.

As may be understood, not all humans will agree as to the predominant flavor of the 'times' during their manifestation. While we may all agree that certain 'times' of the past have a 'definable flavor', much of this comes from the pressed-down concepts and conceits of the historians, and those few 'popular' writers who may convey, intended or not, a particular context or 'flavor' for the 'times' about which they write. But would the humans alive in the 'times' under discussion agree that they also tasted 'that particular flavor' within the 'times' as they were lived? Certainly not everywhere, nor for all humans.

The diversity of humans makes the question of the 'flavor of the times' more interesting as our processing would tend to show the diversity, rather than a consensus of emotion view. It is also our understanding that the consensus emotional view develops over time, and is usually a historical {ed note: mostly bogus and of limited value} conceit of writers. However, currently the modelspace is defining the 'times' for us with a very robust and completely populated descriptor set. This is rather a surprising development. Under the descriptor for 'times', as a sub set of the lexicon which includes descriptors for a 'commonly held view {of the} times', the modelspace has now placed the rising aspect of 'transformational' with the primary supporting aspect of bespoke emotional 'dread'. Hmmm. So apparently it is possible for a 'flavor of the times' to be perceived at a consensus level while the 'times' are occurring. Would not have thought that, but then again as humans we should be used to 'universe surprises'. They seemingly occur often enough.

Our surprise not withstanding, the issue of the rising 'transformation' and 'dread' does point to a mass consciousness appreciation of the nature of the 'times' upon which all humans are now gnawing. It also seemingly reinforces the idea that the 'conflict' meta data level will indeed manifest as projected, thus acting as one of the supporting pillars for the 'dread' emotions concerning these unfolding days. We note that as these days manifest around us, carrying along our impressions, they become the 'grit' in the stew. It is as though universe has made humans a stew with unwashed vegetables and as we gnaw on our time-dinner-stew, our monkey-minds take over and we fixate on the 'grit on the tooth'. The mind is grabbed by each individual grain of sand our teeth encounter {our days}, but apparently the flavor of the stew as a whole {our times} is still coming through. And the modelspace is saying we think that our particular times-stew tastes dread.

There are many conflicting as well as complementary components which affect both the times and our processing. In the case of the latter, the outcome is frequently exposed over multiple weeks of processing as the immediacy values are added to the shorter term values and in turn their sums folded into the longer term values set. We thus expect that more remains of our developing 'oceans' processing. While the supporting structures are fully populated at the moment, their data set is limited to the immediacy values, and some small faction of shorter term value set {ed note: an artifact of the processing sequence}. The thinking is that *anything* which impacts the 'oceans' as a whole will have 'no-sheeeit-staggering/shocking' transformational issues for humanity as a whole, therefore the expectation would be for much larger volumes of emotional tension to build. Thus while we are picking up 'oceans' and 'primary/fundamental/core' and 'transformation' in some abundance at the moment, the thinking is that this is just the mere beginning which would place the

manifestation of the 'transformation' some point into the future. This is somewhat troubling as our modelspace shows that in 2007/2008 a very-very-very large emotional building period which is even steeper than the pending emotional building period indicated on the chart above will present itself. It will also be followed by a very steep and deep emotional release period, and you know how those feel.

It seems somewhat likely then that the 'oceans' issue, and perhaps the 'global coastal event' are over a year into the future. If so, then given the movement of modelspace over 2007/2008/2009, the 'transformational oceanic experience' will also be a 'humanity transformational experience'.

At the 'very deep end' of our radical linguistic explorations of changing lexicons our data sets are showing that a 'curious association' {ed note: alternatively an 'association of the curious'} will be 'created/mandated' over these next few months, perhaps as much as a year. What is interesting about this is that while there are elements of a 'self-organizing collective' about this 'curious association', it would appear to also be 'mandated' by ThePowersThatBe. Hmmm. In spite of the ambiguity of its formation, the 'curious association' will include 'cogitating humans', or alternatively 'professional thinkers', *but* there is little to no lexical language for 'academia/academic'. Nor for that matter much language going to anything 'official/officialdom'. In the developing lexical sets there are showing indications for the 'retreat {in the} wilderness/woods/forests' to be 'penetrated/opened' such that the 'retired/hermit cogitators' can be 'approached'. The use of the descriptor 'retired' here is misleading in that it goes to the idea of someone who 'self extracts' from social contacts, rather than a person of 'retirement age' who is no longer working. The data also reinforces that idea in that much of the language describing the 'cogitators' is 'young/youth' oriented. So the impression coming out from the data is of a 'deep thought' kind of project being put together whose core is a group of 'self-extracting thinkers scattered among the wilderness'.

As we have proceeded in the processing, and co-incident with identifying {ed note: we *think*} the Morgellons parasite as our previously discussed {ed note: starting about 2/two years ago} 'sun disease', we have restructured the lexicon to include 'morgellons' as a populace entity sub set. That is we allow for the rise of the potential for this language within either or both of the populace entities, Populace/USofA and GlobalPop. This was done as the Morgellons parasite does *not* share much with any of the other 1000/one-thousand known human afflicting parasites. And as the Morgellons "disease" is both rising in public consciousness, and is sooooo damn strange as to demand its own linguistic descriptor set, we have altered the lexicon to include this descriptor. As this was done during this ALTA series, we will likely *only* get small clues as the descriptor set builds within the entity. It usually takes several ALTA series runs to build up what we term a 'complete and correct, fully populated' sub set around the descriptor and from which we may make a few of our outlandish, and fantastically improbable interpretations. At this point within the processing the only item of information which we can present is that the 'morgellons' sub set is *mostly* appearing within the Populace/USofA. In point of fact the references are so focused on the USofA as to be peculiar in the extreme. Common sense and the availability of global commercial air travel would suggest a distribution pattern of the language *other* than what is appearing. The Morgellons parasite/disease/conundrum, unless named/labeled in some other wording in other languages is *seemingly* almost exclusively appearing within the continental/hemispheric USofA. Also it has another curious association in that it is instantly bonded to the meta data layer of 'restricted movement'. This bonding is strange in that we find it in both the immediacy values as well as the shorter term value set. We are not yet able to determine if the 'morgellons' is a causative factor in 'restricted movement', or rather will be affected by 'restrictions on movement'. In other words, will there be restrictions on movements as a *result* of the spread of the 'morgellons'? We can't say with so little data yet gathered. But still, the curiosities about this curious parasite continue and exist at very primary levels within our modelspace.

Part 3 of this series is anticipated to be posted by late Sunday, August 20th. We are *hoping* that the data flow will provide sufficient resources for an extraction of a much further looking chart as the data begins to include the longer term emotional summations. Our goal is to chart the total extent of the next release period and necessarily, just a little bit beyond.

So, stay tuned to your reality for the manifestations mentioned here. If events or processing warrant, addendums may be forth coming.
